mlrCPO-package

*Composable Preprocessing Operators***Description**

mlrCPO is a toolset that enriches `mlr` with a diverse set of preprocessing operators. Composable Preprocessing Operators (“CPO”s) are first-class R objects that can be applied to `data.frames` and `mlr Tasks` to modify data, they can be attached to `mlr Learners` to add preprocessing to machine learning algorithms, and they can be composed to form preprocessing pipelines.

mLrCPO focuses on preprocessing as part of automated machine learning pipelines. This means that it is designed with the expectation that the same preprocessing options are applied to incoming training data, and test data. A common mistake in machine learning is that a machine learning method is evaluated (e.g. using resampling) on a dataset *after* that dataset has been cleaned up and preprocessed in one go. The proper evaluation would need to consider that the preprocessing of training data may not be influenced by any information contained in the test data set. mLrCPO takes this duality into account by providing CPO objects that run on training data, and which then create CPOTrained objects that can be used on test data (or entirely new prediction data).

This focus on preprocessing is the reason for a strict separation between “Feature Operation” CPOs, “Target Operation” CPOs, and “Retrafoless” CPOs (see [OperatingType](#)). The first class only changes (predictor) features of a dataset, and does so in a way reproducible on test data. The second class only changes (outcome) target data of a dataset, and is then able to [invert](#) the prediction, made by a learner on new data, back to the space of the original target data. The “Retrafoless” CPO only operates during training and may only add or subtract data rows (e.g. for SMOTE-ing or subsampling), without transforming the space of either predictor or outcome variables.

CPO’s design is supposed to help its user avoid bugs and errors. Therefore it often avoids doing things implicitly and relies on explicit commands e.g. for removing data or converting between datatypes. It has certain restrictions in place (e.g. [CPOProperties](#), [CPOTrainedCapability](#)) that try to make it hard to do the wrong thing while not being in the way of the right thing.

Other packages with similar, partially overlapping functionality are [recipes](#), [dplyr](#), and [caret](#).

 applyCPO

Apply a CPO to Data

Description

The given transformation will be applied to the data in the given [Task](#) or [data.frame](#).

If the input data is a [data.frame](#), the returned object will in most cases also be a [data.frame](#), with exceptions if the applied CPO performs a conversion to a [Task](#). If the input data is a [Task](#), its type will only be changed to a different type of [Task](#) if the applied CPO performs such a conversion.

The `%>>%` operator can be used synonymously to apply CPO objects to data. In case of [CPORetrafo](#), [predict](#) can be used synonymously.

Usage

```
applyCPO(cpo, task)
```

Arguments

cpo	[CPO CPORetrafo] The CPO or CPORetrafo representing the operation to perform.
task	[Task data.frame] The data to operate on.

Value

Task | `data.frame` . The transformed data, augmented with a `inverter` and possibly a `retrafo` tag.

Application of CPO

Application of a `CPO` is supposed to perform *preprocessing* on a given data set, to prepare it e.g. for model fitting with a `Learner`, or for other data handling tasks. When this preprocessing is performed, care is taken to make the transformation repeatable on later prediction or validation data. For this, the returned data set will have a `CPORetrafo` and `CPOInverter` object attached to it, which can be retrieved using `retrafo` and `inverter`. These can be used to perform the same transformation on new data, or to invert a prediction made with the transformed data.

An applied `CPO` can change the content of feature columns, target columns of Tasks, and may even change the number of rows of a given data set.

Application of CPORetrafo

Application of a `CPORetrafo` is supposed to perform a transformation that mirrors the transformation done before on a training data set. It should be used when trying to make predictions from new data, using a model that was trained with data preprocessed using a `CPO`. The predictions made may then need to be inverted. For this, the returned data set will have a `CPOInverter` object attached to it, which can be retrieved using `inverter`.

An applied `CPORetrafo` may change the content of feature columns and target columns of Tasks, but will never change the number or order of rows of a given data set.

as.list.CPO

Split a Pipeline into Its Constituents

Description

Split a compound `CPO` or `CPOTrained` into a list of its constituent parts.

This is useful for inspection of pipelines, or for possible rearrangements or changes of pipelines. The resulting `list` can be changed and rebuilt using `pipeCPO`.

Usage

```
## S3 method for class 'CPOPrimitive'
as.list(x, ...)

## S3 method for class 'CPOTrained'
as.list(x, ...)
```

Arguments

x	[CPO CPOTrained] The CPO or CPOTrained chain to split apart.
...	[any] Ignored.

Value

list of CPO | list of CPOTrained . The primitive constituents of x.

See Also

Other operators: CPO, %>%(), applyCPO(), attachCPO(), composeCPO(), pipeCPO()

Other retrafo related: CPOTrained, NULLCPO, %>%(), applyCPO(), clearRI(), getCPOClass(), getCPOName(), getCPOOperatingType(), getCPOPredictType(), getCPOProperties(), getCPOTrainedCPO(), getCPOTrainedCapability(), getCPOTrainedState(), is.retrafo(), makeCPOTrainedFromState(), pipeCPO(), print.CPOConstructor()

Other inverter related: CPOTrained, NULLCPO, %>%(), applyCPO(), clearRI(), getCPOClass(), getCPOName(), getCPOOperatingType(), getCPOPredictType(), getCPOProperties(), getCPOTrainedCPO(), getCPOTrainedCapability(), getCPOTrainedState(), is.inverter(), makeCPOTrainedFromState(), pipeCPO(), print.CPOConstructor()

attachCPO

Attach a CPO to a Learner

Description

A CPO object can be attached to a Learner object to create a pipeline combining preprocessing and model fitting. When the resulting CPOLearner is used to create a model using train, the attached CPO will be applied to the data before the internal model is trained. The resulting model will also contain the required CPOTrained elements, and apply the necessary CPORetrafo objects to new prediction data, and the CPOInverter objects to predictions made by the internal model.

The %>% operator can be used synonymously to attach CPO objects to Learners.

Usage

```
attachCPO(cpo, learner)
```

Arguments

cpo	[CPO] The cpo.
learner	[Learner] The learner.

Other CPOLearner related: [CPOLearner](#), [getLearnerBare\(\)](#), [getLearnerCPO\(\)](#)

clearRI

Clear Retrafo and Inverter Attributes

Description

When applying [CPOs](#) to data, the operation entails saving the [CPOTrained](#) information that gets generated to an attribute of the resulting object. This is a useful solution to the problem that applying multiple CPOs should also lead to a [retrafo](#) object that performs the same multiple operations. However, sometimes this may lead to surprising and unwanted results when a CPO is applied and not meant to be part of a [trafo-retrafo](#) machine learning pipeline, e.g. for dropping columns that occur in training but not in prediction data. In that case, it is necessary to reset the [retrafo](#) and possibly inverter attributes of the data being used. This can be done either by using `retrafo(data) <- NULL`, or by using `clearRI`. `clearRI` clears both [retrafo](#) *and* inverter attributes.

Usage

```
clearRI(data)
```

Arguments

data	[data.frame Task WrappedModel] The result of a CPO applied to a data set.
------	--

Value

[data.frame](#) | [Task](#) | [WrappedModel](#) the data after stripping all [retrafo](#) and inverter attributes.

Other inverter related: `CPOTrained`, `NULLCPO`, `%>>%()`, `applyCPO()`, `as.list.CPO`, `getCPOClass()`, `getCPOName()`, `getCPOOperatingType()`, `getCPOPredictType()`, `getCPOProperties()`, `getCPOTrainedCPO()`, `getCPOTrainedCapability()`, `getCPOTrainedState()`, `is.inverter()`, `makeCPOTrainedFromState()`, `pipeCPO()`, `print.CPOConstructor()`

Examples

```
# without clearRI
transformed = iris.task %>>% cpoPca()
transformed2 = transformed %>>% cpoScale()
retrafo(transformed2) # [RETRAFO pca]=>[RETRAFO scale]

transformed = iris.task %>>% cpoPca()
transformed2 = clearRI(transformed) %>>% cpoScale()
retrafo(transformed2) # [RETRAFO scale]
```

 composeCPO

CPO Composition

Description

Composes `CPO` or `CPOTrained` objects. The `%>>%` operator can be used synonymously to compose `CPO` objects.

Composition of operators is one of the main features they provide: this makes it possible for complex operations to be represented by single objects. Compound operators represent the operation of applying both its constituent operations in succession. Compound operators can themselves be composed to form arbitrarily long chains of operators.

Compound objects behave, in most ways, like primitive objects. Some exceptions are:

- Compound CPOs do not have an ID, so `getCPOId` and `setCPOId` will not work on them.
- Compound CPOs have no 'affect' property, so `getCPOAffect` will not work.

While `CPOTrained` operators can be composed just as `CPO` operators, this is only recommended in cases where the same primitive `CPOTrained` objects were retrieved using `as.list.CPOTrained`. This is because `CPOTrained` are closely related to the data that was used to create it, and therefore on their original position in the `CPO` pipeline during training.

Usage

```
composeCPO(cpo1, cpo2)
```

Arguments

cpo1	[CPO CPOTrained] The operation to perform first.
cpo2	[CPO CPOTrained] The operation to perform second, must have the same class as cpo1.

Value

CPO | CPOTrained . The operation representing the application of cpo1 followed by the application of cpo2.

See Also

Other operators: CPO, %>%(), applyCPO(), as.list.CPO, attachCPO(), pipeCPO()

Other CPO lifecycle related: CPOConstructor, CPOLearner, CPOTrained, CPO, NULLCPO, %>%(), attachCPO(), getCPOClass(), getCPOConstructor(), getCPOTrainedCPO(), identicalCPO(), makeCPO()

covrTraceCPOs	<i>Add 'covr' coverage to CPOs</i>
---------------	------------------------------------

Description

Use this if you want to check code coverage of CPOs using covr. The functions inside CPOs is originally not accessible to covr, so covrTraceCPOs needs to be called in the .onAttach function. Note that putting it in .onLoad will **not** work.

Currently, for this to work, the mb706 fork of covr needs to be used. To install it, call
devtools::install_github("mb706/covr")

To use it on Travis CI, add the line - mb706/covr under the r_github_packages: category.

This function comes at no runtime penalty: If the R_COVR environment variable is not set to "true", then it only has an effect if force is TRUE.

Usage

```
covrTraceCPOs(env = parent.env(parent.frame()), force = FALSE)
```

Arguments

env	[environment] The environment to search for CPOs. Default is parent.env(parent.frame()), which is the package namespace if called from .onLoad.
force	[logical(1)] Trace CPO functions even when R_COVR is not "true". Default is FALSE.

Value

invisible(NULL) .

Description

Composable Preprocessing Operators, or CPO, are the central entity provided by the `mlrCPO` package. CPOs can perform operations on a `data.frame` or a `Task`, for the latter even modifying target values and converting between different `Task` types.

CPOs can be “composed” using the `%>>%` operator, the `composeCPO` function, or the `pipeCPO` function, to create new (“compound”) operators that perform multiple operations in a pipeline. While all CPOs have the class “CPO”, primitive (i.e. not compound) CPOs have the additional class “CPOPrimitive”, and compound CPOs have the class “CPOPipeline”. It is possible to split a compound CPOs into its primitive constituents using `as.list.CPO`.

CPOs can be “attached” to a `mlr-Learner` objects to create `CPOLearners`, using the `%>>%` operator, or the `attachCPO` function. These `CPOLearners` fit the model specified by the `Learner` to the data after applying the attached CPO. Many CPOs can be attached to a `Learner` sequentially, or in form of a compound CPO.

CPOs can be “applied” to a `data.frame` or a `Task` using the `%>>%` operator, or the `applyCPO` function. Applying a CPO performs the operations specified by the (possibly compound) CPO, and returns the modified data. This data also contains a “retrafo” and an “inverter” tag, which can be accessed using the `retrafo` and `inverter` functions to get `CPORetrafo` and `CPOInverter` objects, respectively. These objects represent the “trained” CPOs that can be used when performing validation or predictions with new data.

Hyperparameters

CPOs can have hyperparameters that determine how they operate on data. These hyperparameters can be set during construction, as function parameters of the `CPOConstructor`, or they can potentially be modified later as exported hyperparameters. Which hyperparameters are exported is controlled using the `export` parameter of the `CPOConstructor` when the CPO was created. Hyperparameters can be listed using `getParamSet`, queried using `getHyperPars` and set using `setHyperPars`.

S3 properties

A CPO object should be treated as an opaque object and should only be queried / modified using the given `set*` and `get*` functions. A list of them is given below in the section “See Also”—“cpo-operations”.

Special CPO

A special CPO is `NULLCPO`, which functions as the neutral element of the `%>>%` operator and represents the identity operation on data.

See Also

`print.CPO` for possibly verbose printing.

Other CPO lifecycle related: `CPOConstructor`, `CPOLearner`, `CPOTrained`, `NULLCPO`, `%>>%()`, `attachCPO()`, `composeCPO()`, `getCPOClass()`, `getCPOConstructor()`, `getCPOTrainedCPO()`, `identicalCPO()`, `makeCPO()`

Other operators: `%>>%()`, `applyCPO()`, `as.list.CPO`, `attachCPO()`, `composeCPO()`, `pipeCPO()`

Other getters and setters: `getCPOAffect()`, `getCPOClass()`, `getCPOConstructor()`, `getCPOId()`, `getCPOName()`, `getCPOOperatingType()`, `getCPOPredictType()`, `getCPOProperties()`, `getCPOTrainedCPO()`, `getCPOTrainedCapability()`, `setCPOId()`

Other CPO classifications: `getCPOClass()`, `getCPOOperatingType()`, `getCPOTrainedCapability()`

Examples

```
class(cpoPca()) # c("CPOPrimitive", "CPO")
class(cpoPca() %>>% cpoScale()) # c("CPOPipeline", "CPO")
print(cpoPca() %>>% cpoScale(), verbose = TRUE)

getHyperPars(cpoScale(center = FALSE))

head(getTaskData(iris.task %>>% cpoScale()))
```

cpoApplyFun

Apply a Function Element-Wise

Description

This is a `CPOConstructor` to be used to create a `CPO`. It is called like any R function and returns the created `CPO`.

The function must either vectorize over the given data, or will be applied to each data element on its own.

It must not change the type of the data, i.e. numeric data must remain numeric etc.

If the function can only handle a subset of the given columns, e.g. only a certain type, use `affect.*` arguments.

Usage

```
cpoApplyFun(
  fun,
  param = NULL,
  vectorize = TRUE,
  make.factors = TRUE,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
```

```

    affect.names = character(0),
    affect.pattern = NULL,
    affect.invert = FALSE,
    affect.pattern.ignore.case = FALSE,
    affect.pattern.perl = FALSE,
    affect.pattern.fixed = FALSE
  )

```

Arguments

fun	[function] The function to apply. If vectorize is TRUE, the argument is a vector of the whole column, fun must vectorize over it and return a vector of the same length; otherwise, the function gets called once for every data item, and both the function argument and the return value must have length 1. The function must take one or two arguments. If it takes two arguments, the second argument will be param.
param	[any] Optional argument to be given to fun. If fun only takes one argument, this is ignored. Default is NULL.
vectorize	[logical(1)] Whether to call fun once for each column, or once for each element. If fun vectorizes, it is recommended to have this set to TRUE for better performance. Default is TRUE.
make.factors	[logical(1)] Whether to turn resulting logical and character columns into factor columns (which are preferred by mlr). Default is TRUE.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).

<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is <code>character(0)</code> .
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

Value

[CPO](#) .

CPOTrained State

The created state is empty.

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

`cpoApplyFunRegrTarget` *Transform a Regression Target Variable*

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Apply a given function to the target column of a regression [Task](#).

Usage

```
cpoApplyFunRegrTarget(
  trafo,
  invert.response = NULL,
  invert.se = NULL,
  param = NULL,
  vectorize = TRUE,
  gauss.points = 23,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

trafo	[function] A function transforming the target column. If <code>vectorize</code> is <code>TRUE</code> , the argument is a vector of the whole column, <code>trafo</code> must vectorize over it and return a vector of the same length; otherwise, the function gets called once for every data item, and both the function argument and the return value must have length 1. The function must take one or two arguments. If it takes two arguments, the second argument will be <code>param</code> .
invert.response	[function] If a model is trained on data that was transformed by <code>trafo</code> , this function should invert a prediction made by this model back to the space of the original data. In most cases, this will be the inverse of <code>trafo</code> , so that <code>invert.response(trafo(x)) == x</code> . Similarly to <code>trafo</code> , this function takes / produces single elements or the whole column, depending on <code>vectorize</code> . The return value should be a numeric in both cases. This can also be <code>NULL</code> , in which case using this CPO for <code>invert</code> with <code>predict.type = "response"</code> is not possible. Default is <code>NULL</code> .
invert.se	[function] Similarly to <code>invert.response</code> , this is a function that inverts a "se" prediction made after training on <code>trafo</code> 'd data. This function should take at least two arguments, <code>mean</code> and <code>se</code> , and return a numeric vector of length 2 if <code>vectorize</code> is <code>FALSE</code> , or a <code>data.frame</code> or <code>matrix</code> with two numeric columns if <code>vectorize</code> is <code>TRUE</code> . The function may also take a third argument, which will be set to <code>param</code> . <code>invert.se</code> may also be <code>NULL</code> , in which case "se" inversion is done by numeric integration using Gauss-Hermite quadrature. Default is <code>NULL</code> .
param	[any] Optional argument to be given to <code>trafo</code> and / or <code>invert</code> . If both of them only take one argument, this is ignored. Default is <code>NULL</code> .
vectorize	[logical(1)] Whether to call <code>trafo</code> , <code>invert.response</code> and <code>invert.se</code> once with the whole data column (or <code>response</code> and <code>se</code> column if <code>predict.type == "se"</code>), or once for each element. If the functions <code>vectorize</code> , it is recommended to have this set to <code>TRUE</code> for better performance. Default is <code>TRUE</code> .
gauss.points	[numeric(1)] Number of points at which to evaluate <code>invert.response</code> for Gauss-Hermite quadrature integration. Only used if <code>invert.se</code> is <code>NULL</code> . Default is 23.
id	[character(1)] <code>id</code> to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.

<code>export</code>	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values “export.all” (export all parameters), “export.default” (export all parameters that are exported by default), “export.set” (export all parameters that were set during construction), “export.default.set” (export the intersection of the “default” and “set” parameters), “export.unset” (export all parameters that were <i>not</i> set during construction) or “export.default.unset” (export the intersection of the “default” and “unset” parameters). Default is “export.default”.
<code>affect.type</code>	[character NULL] Type of columns to affect. A subset of “numeric”, “factor”, “ordered”, “other”, or NULL to not match by column type. Default is NULL.
<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

Value

CPO .

Details

When both mean and se prediction is available, it may be possible to make more accurate mean inversion than for the response `predict.type`, using integrals or approximations like the *delta method*. In such cases it may be advisable to prepend this [CPO](#) with the `cpoResponseFromSE` [CPO](#).

Note when `trafo` or `invert.response` take more than one argument, the second argument will be set to the value of `param`. This may lead to unexpected results when using functions with rarely

used parameters, e.g. `log`. In these cases, it may be necessary to wrap the function: `trafo = function(x) log(x)`.

General CPO info

This function creates a CPO object, which can be applied to `Tasks`, `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function `setHyperPars`. The other hyper-parameter manipulating functions, `getHyperPars` and `getParamSet` similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

cpoAsNumeric

Convert All Features to Numerics

Description

This is a `CPOConstructor` to be used to create a `CPO`. It is called like any R function and returns the created `CPO`.

Converts all feature columns to (integer) numeric columns by applying `as.numeric` to them.

Usage

```

cpoAsNumeric(
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)

```

Arguments

<code>id</code>	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
<code>export</code>	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
<code>affect.type</code>	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.

```

affect.pattern.perl
    [logical(1)]
    Use Perl-style regular expressions for affect.pattern; see grep. Default is
    FALSE.
affect.pattern.fixed
    [logical(1)]
    Use fixed matching instead of regular expressions for affect.pattern; see
    grep. Default is FALSE.

```

cpoCache

Caches the Result of CPO Transformations

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Given a [CPO](#) to wrap, this caches an intermediate result (in fact, the [retrafo](#) object) whenever the CPO is applied to a `Task` or `data.frame`. This can reduce computation time when the same CPO is often applied to the same data, e.g. in a resampling or tuning evaluation.

The hyperparameters of the CPO are not exported, since in many cases changing the hyperparameters will also change the result and would defeat the point of caching. To switch between different settings of the same [CPO](#), consider using [cpoMultiplex](#).

The cache is kept in an [environment](#); therefore, it does not communicate with other threads or processes when using parallelization at a level before the cache gets filled.

Caching needs the ‘digest’ package to be installed.

Usage

```
cpoCache(cpo = NULLCPO, cache.entries = 1024)
```

Arguments

cpo	[CPO] The CPO to wrap. The CPO may only have a single OperatingType . Default is <code>NULLCPO</code> .
cache.entries	[numeric(1)] Number of entries in the least recently used cache.

Value

[CPO](#) .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

cpoCbind

“cbind” the Result of Multiple CPOs

Description

This is a `CPOConstructor` to be used to create a `CPO`. It is called like any R function and returns the created `CPO`.

Build a `CPO` that represents the operations of its input parameters, performed in parallel and put together column wise.

For example, to construct a `Task` that contains the original data, as well as the data after scaling, one could do

```
task %>>% cpoCbind(NULLCPO, cpoScale())
```

The result of `cpoCbind` is itself a `CPO` which exports its constituents’ hyperparameters. `CPOs` with the same type / `ID` get combined automatically. To get networks, e.g. of the form

```

      , -C--E-.
     /   /   \
A----B-----D-----F----G

```

one could use the code

```

initcpo = A %>>% B
route1 = initcpo %>>% D
route2 = cpoCbind(route1, initcpo %>>% C) %>>% E
result = cpoCbind(route1, route2) %>>% F %>>% G

```

cpoCbind finds common paths among its arguments and combines them into one operation. This saves computation and makes it possible for one exported hyperparameter to influence multiple of cpoCbind's inputs. However, if you want to use the same operation with different parameters on different parts of cpoCbind input, you must give these operations different IDs. If CPOs that could represent an identical CPO, with the same IDs (or both with IDs absent) but different parameter settings, affect.* settings or different parameter exportations occur, an error will be thrown.

Usage

```
cpoCbind(..., .cpo = list())
```

Arguments

...	[CPO] The CPOs to cbind. These must be Feature Operation CPOs. Named arguments will result in the respective columns being prefixed with the name. This is highly recommended if there is any chance of name collision otherwise. It is possible to use the same name multiple times (provided the resulting column names don't clash).
.cpo	[list of CPO] Alternatively, give the CPOs to cbind as a list. Default is list().

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}s` and other CPO objects using the `%>>%` operator.

The parameters of this object can be changed after creation using the function `setHyperPars`. The other hyper-parameter manipulating functions, `getHyperPars` and `getParamSet` similarly work as one expects.

If the "id" parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional "special" optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

Other special CPOs: `cpoTransformParams()`, `cpoWrap()`, `makeCPOCase()`, `makeCPOMultiplex()`

<code>cpoCollapseFact</code>	<i>Combine Rare Factors</i>
------------------------------	-----------------------------

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Combine rare factor levels into a single factor level.

Usage

```
cpoCollapseFact(
  max.collapsed.class.prevalence = 0.1,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.per1 = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

`max.collapsed.class.prevalence`
 [numeric(1)]
 Maximum prevalence of newly created collapsed factor level. Default is 0.1.

id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
affect.invert	[logical(1)] Whether to affect all features <i>not</i> matched by other affect.* parameters.
affect.pattern.ignore.case	[logical(1)] Ignore case when matching features with affect.pattern; see grep . Default is FALSE.
affect.pattern.perl	[logical(1)] Use Perl-style regular expressions for affect.pattern; see grep . Default is FALSE.
affect.pattern.fixed	[logical(1)] Use fixed matching instead of regular expressions for affect.pattern; see grep . Default is FALSE.

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}`s and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function `setHyperPars`. The other hyper-parameter manipulating functions, `getHyperPars` and `getParamSet` similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

CPOConstructor

Constructor for CPO Objects

Description

CPO objects are created by calling CPOConstructors, which are R functions that have some parameters in common, use a convenient `print.CPOConstructor` generic, and always return a CPO object. The `mlrCPO` package provides many CPOConstructor functions, which can be listed using `listCPO`. It is also possible to create custom CPOConstructors using `makeCPO`, `makeCPORetrafoless`, `link{makeCPOTargetOp}`, and `makeCPOExtendedTrafo`.

Arguments

`id` [character(1) | NULL]
 ID to use for the CPO. if NULL is given, this defaults to a name describing the action performed by the CPO, which can be retrieved using `getCPOName`. The ID is used to identify the CPO in print messages, and is prefixed to the CPO’s

hyperparameter names. This can be used to avoid name clashes when composing a CPO with another CPO or [Learner](#) with hyperparameters with clashing names. Default is NULL.

export	[character]	Which hyperparameters to export. This can be a character vector naming the hyperparameters to export (<i>excluding</i> the ID), or a character(1) with one of the special values:
	“export.all”	export all parameters
	“export.default”	exp. params that are exp. by def
	“export.set”	exp. params set in construct call
	“export.default.set”	intersection of “default” and “set”
	“export.unset”	params <i>not</i> set in construct call
	“export.default.unset”	isct. of “default” and “unset”
	“export.all.plus”	not yet supported
		Default is “export.default”.
affect.type	[character NULL]	Type of columns to affect. May be a subset of “numeric”, “factor”, “ordered”, “other”, or can be or NULL to match all columns. Default is NULL.
affect.index	[numeric]	Indices of feature columns to affect. The order of indices given is respected. Default is integer(0).
affect.names	[character]	Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL]	grep pattern to match feature names by. Default is NULL (no pattern matching)
affect.invert	[logical(1)]	Whether to affect all features <i>not</i> matched by other affect.* parameters. Default is FALSE.
affect.pattern.ignore.case	[logical(1)]	Ignore case when matching features with affect.pattern; see grep . Has no effect when affect.pattern is NULL. Default is FALSE.
affect.pattern.perl	[logical(1)]	Use Perl-style regular expressions for affect.pattern; see grep . Has no effect when affect.pattern is NULL, or when affect.pattern.fixed is TRUE. Default is FALSE.
affect.pattern.fixed	[logical(1)]	Use fixed matching instead of regular expressions for affect.pattern; see grep . Has no effect when affect.pattern is NULL. Default is FALSE.

Value

[CPO](#) the constructed CPO.

CPO creation

CPOConstructors can be called like any R function, with any parameters given. Besides parameters that are common to most CPOConstructors (listed below), it is possible to set CPO-specific hyper-parameters in the construction. Parameters that are being *exported* can also be modified later using the CPO object, see the documentation there.

affect.* parameters

When creating a CPO, it is possible to choose which columns of the given data the CPO operates on, and which columns it will ignore. This is done using the affect.* parameters. It is possible to choose columns by types, indices, names, or a regular expression matching names.

Examples

```
class(cpoPca) # c("CPOConstructor", "function")
print(cpoPca) # default printer
print(cpoPca, verbose = TRUE) # shows the trafo / retrafo functions

cpoPca() # creating a CPO
class(cpoPca()) # c("CPOPrimitive", "CPO")
```

cpoDropConstants *Drop Constant or Near-Constant Features*

Description

This is a [CPOConstructor](#) to be used to create a CPO. It is called like any R function and returns the created CPO.

Drop all columns that are either constant, or close to constant for numerics, and columns that have only one value for factors or ordered columns.

Usage

```

cpoDropConstants(
  rel.tol = 1e-08,
  abs.tol = 1e-08,
  ignore.na = FALSE,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)

```

Arguments

rel.tol	[numeric(1)] Relative tolerance within which to consider a feature constant. Set to 0 to disregard relative tolerance. Default is 1e-8.
abs.tol	[numeric(1)] Absolute tolerance within which to consider a feature constant. Set to 0 to disregard absolute tolerance. Default is 1e-8.
ignore.na	[logical(1)] Whether to ignore NA and NaN values. If this is TRUE, values that are NA or NaN will not be counted as different from any other value. If this is FALSE, columns with NA or NaN in them will only count as constant if they are entirely made up of NA, or entirely made up of NaN. Default is FALSE.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.

<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is <code>integer(0)</code> .
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is <code>character(0)</code> .
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

`cpoDropMostlyConstants`

Drop Constant or Near-Constant Features

Description

This is a `CPOConstructor` to be used to create a `CPO`. It is called like any R function and returns the created `CPO`.

Drop all columns that are mostly constant: Constant within tolerance with numerics, and columns that have only one value for factors or ordered columns.

This CPO can also filter “mostly” constant Features: ones where at most a fraction of ratio samples differ from the mode value.

Usage

```
cpoDropMostlyConstants(
  ratio = 0,
  rel.tol = 1e-08,
  abs.tol = 1e-08,
  ignore.na = FALSE,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

ratio	[numeric(1)] Minimum ratio of values which must be different from the mode value in order to keep a feature in the task. Default is 0, which means only constant features with exactly one observed level are removed.
rel.tol	[numeric(1)] Relative tolerance within which to consider a feature constant. Set to 0 to disregard relative tolerance. Default is 1e-8.
abs.tol	[numeric(1)] Absolute tolerance within which to consider a feature constant. Set to 0 to disregard absolute tolerance. Default is 1e-8.
ignore.na	[logical(1)] Whether to ignore NA and NaN values. If this is TRUE, values that are NA or NaN will not be counted as different from any other value. If this is FALSE, columns with NA or NaN in them will only count as constant if they are entirely made up of NA, or entirely made up of NaN. Default is FALSE.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
affect.invert	[logical(1)] Whether to affect all features <i>not</i> matched by other affect.* parameters.

`affect.pattern.ignore.case`
 [logical(1)]
 Ignore case when matching features with `affect.pattern`; see [grep](#). Default is FALSE.

`affect.pattern.perl`
 [logical(1)]
 Use Perl-style regular expressions for `affect.pattern`; see [grep](#). Default is FALSE.

`affect.pattern.fixed`
 [logical(1)]
 Use fixed matching instead of regular expressions for `affect.pattern`; see [grep](#). Default is FALSE.

Value

[CPO](#) .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}`s and other CPO objects using the `%>>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

cpoDummyEncode

CPO Dummy Encoder

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Usage

```
cpoDummyEncode(
  reference.cat = FALSE,
  infixdot = FALSE,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

reference.cat	[logical] If “reference.cat” is TRUE, the first level of every factor column is taken as the reference category and the encoding is $c(0, 0, 0, \dots)$. If this is FALSE, the encoding is always one-hot-encoding. Default is FALSE.
infixdot	[logical] Whether to add an infix dot when creating names. This is nicer in some ways, but is not compatible with model.matrix.
id	[character(1)] id to use as prefix for the CPO’s hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values “export.all” (export all parameters), “export.default”

(export all parameters that are exported by default), “export.set” (export all parameters that were set during construction), “export.default.set” (export the intersection of the “default” and “set” parameters), “export.unset” (export all parameters that were *not* set during construction) or “export.default.unset” (export the intersection of the “default” and “unset” parameters). Default is “export.default”.

<code>affect.type</code>	[character NULL] Type of columns to affect. A subset of “numeric”, “factor”, “ordered”, “other”, or NULL to not match by column type. Default is NULL.
<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to `Tasks`, `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function `setHyperPars`. The other hyper-parameter manipulating functions, `getHyperPars` and `getParamSet` similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

cpoFilterAnova

Filter Features: “anova.test”

Description

This is a `CPOConstructor` to be used to create a `CPO`. It is called like any R function and returns the created `CPO`.

Filter “anova.test” is based on the Analysis of Variance (ANOVA) between feature and class. The value of the F-statistic is used as a measure of feature importance.

Usage

```
cpoFilterAnova(
  perc = NULL,
  abs = NULL,
  threshold = NULL,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
```

```

    affect.pattern.ignore.case = FALSE,
    affect.pattern.perl = FALSE,
    affect.pattern.fixed = FALSE
  )

```

Arguments

perc	[numeric(1)] If set, select perc*100 top scoring features. Mutually exclusive with arguments abs and threshold.
abs	[numeric(1)] If set, select abs top scoring features. Mutually exclusive with arguments perc and threshold.
threshold	[numeric(1)] If set, select features whose score exceeds threshold. Mutually exclusive with arguments perc and abs.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
affect.invert	[logical(1)] Whether to affect all features <i>not</i> matched by other affect.* parameters.
affect.pattern.ignore.case	[logical(1)] Ignore case when matching features with affect.pattern; see grep . Default is FALSE.

```

affect.pattern.perl
    [logical(1)]
    Use Perl-style regular expressions for affect.pattern; see grep. Default is
    FALSE.
affect.pattern.fixed
    [logical(1)]
    Use fixed matching instead of regular expressions for affect.pattern; see
    grep. Default is FALSE.

```

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}s` and other CPO objects using the `%>>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

cpoFilterCarscore *Filter Features: "carscore"*

Description

This is a `CPOConstructor` to be used to create a `CPO`. It is called like any R function and returns the created `CPO`.

Filter "carscore" determines the "Correlation-Adjusted (marginal) coRelation scores" (short CAR scores). The CAR scores for a set of features are defined as the correlations between the target and the decorrelated features.

Usage

```
cpoFilterCarscore(
  diagonal = FALSE,
  perc = NULL,
  abs = NULL,
  threshold = NULL,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

<code>diagonal</code>	[logical(1)] See the carscore help.
<code>perc</code>	[numeric(1)] If set, select perc*100 top scoring features. Mutually exclusive with arguments abs and threshold.
<code>abs</code>	[numeric(1)] If set, select abs top scoring features. Mutually exclusive with arguments perc and threshold.
<code>threshold</code>	[numeric(1)] If set, select features whose score exceeds threshold. Mutually exclusive with arguments perc and abs.

id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
affect.invert	[logical(1)] Whether to affect all features <i>not</i> matched by other affect.* parameters.
affect.pattern.ignore.case	[logical(1)] Ignore case when matching features with affect.pattern; see grep . Default is FALSE.
affect.pattern.perl	[logical(1)] Use Perl-style regular expressions for affect.pattern; see grep . Default is FALSE.
affect.pattern.fixed	[logical(1)] Use fixed matching instead of regular expressions for affect.pattern; see grep . Default is FALSE.

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}`s and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function `setHyperPars`. The other hyper-parameter manipulating functions, `getHyperPars` and `getParamSet` similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the id parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

`cpoFilterChiSquared` *Filter Features: “chi.squared”*

Description

This is a `CPOConstructor` to be used to create a `CPO`. It is called like any R function and returns the created `CPO`.

The chi-square test is a statistical test of independence to determine whether two variables are independent. Filter “chi.squared” applies this test in the following way. For each feature the chi-square test statistic is computed checking if there is a dependency between the feature and the target variable. Low values of the test statistic indicate a poor relationship. High values, i.e., high dependency identifies a feature as more important.

Usage

```

cpoFilterChiSquared(
  perc = NULL,
  abs = NULL,
  threshold = NULL,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)

```

Arguments

perc	[numeric(1)] If set, select perc*100 top scoring features. Mutually exclusive with arguments abs and threshold.
abs	[numeric(1)] If set, select abs top scoring features. Mutually exclusive with arguments perc and threshold.
threshold	[numeric(1)] If set, select features whose score exceeds threshold. Mutually exclusive with arguments perc and abs.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Tar-

	get column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
affect.invert	[logical(1)] Whether to affect all features <i>not</i> matched by other affect.* parameters.
affect.pattern.ignore.case	[logical(1)] Ignore case when matching features with affect.pattern; see grep . Default is FALSE.
affect.pattern.perl	[logical(1)] Use Perl-style regular expressions for affect.pattern; see grep . Default is FALSE.
affect.pattern.fixed	[logical(1)] Use fixed matching instead of regular expressions for affect.pattern; see grep . Default is FALSE.

Value

[CPO](#) .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

cpoFilterFeatures

Filter Features by Thresholding Filter Values

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

First, calls [generateFilterValuesData](#). Features are then selected via `select` and `val`.

Usage

```
cpoFilterFeatures(
  method = "randomForestSRC.rfsrc",
  fval = NULL,
  perc = NULL,
  abs = NULL,
  threshold = NULL,
  filter.args = list(),
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

method	[character(1)] See listFilterMethods . Default is “randomForestSRC.rfsrc”.
fval	[FilterValues] Result of generateFilterValuesData . If you pass this, the filter values in the object are used for feature filtering. method and ... are ignored then. Default is NULL and not used.
perc	[numeric(1)] If set, select perc*100 top scoring features. Mutually exclusive with arguments abs and threshold.
abs	[numeric(1)] If set, select abs top scoring features. Mutually exclusive with arguments perc and threshold.
threshold	[numeric(1)] If set, select features whose score exceeds threshold. Mutually exclusive with arguments perc and abs.
filter.args	[list] Passed down to selected filter method. Default is list().
id	[character(1)] id to use as prefix for the CPO’s hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOs with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values “export.all” (export all parameters), “export.default” (export all parameters that are exported by default), “export.set” (export all parameters that were set during construction), “export.default.set” (export the intersection of the “default” and “set” parameters), “export.unset” (export all parameters that were <i>not</i> set during construction) or “export.default.unset” (export the intersection of the “default” and “unset” parameters). Default is “export.default”.
affect.type	[character NULL] Type of columns to affect. A subset of “numeric”, “factor”, “ordered”, “other”, or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
affect.invert	[logical(1)] Whether to affect all features <i>not</i> matched by other affect.* parameters.

```

affect.pattern.ignore.case
    [logical(1)]
    Ignore case when matching features with affect.pattern; see grep. Default
    is FALSE.
affect.pattern.perl
    [logical(1)]
    Use Perl-style regular expressions for affect.pattern; see grep. Default is
    FALSE.
affect.pattern.fixed
    [logical(1)]
    Use fixed matching instead of regular expressions for affect.pattern; see
    grep. Default is FALSE.

```

Value

[CPO](#) .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}`s and other CPO objects using the `%>>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

cpoFilterGainRatio *Filter Features: "gain.ratio"*

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Filter "gain.ratio" uses the entropy-based information gain ratio between each feature and target individually as an importance measure.

Usage

```
cpoFilterGainRatio(
  perc = NULL,
  abs = NULL,
  threshold = NULL,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

perc [numeric(1)]
If set, select perc*100 top scoring features. Mutually exclusive with arguments abs and threshold.

abs	[numeric(1)] If set, select abs top scoring features. Mutually exclusive with arguments perc and threshold.
threshold	[numeric(1)] If set, select features whose score exceeds threshold. Mutually exclusive with arguments perc and abs.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
affect.invert	[logical(1)] Whether to affect all features <i>not</i> matched by other affect.* parameters.
affect.pattern.ignore.case	[logical(1)] Ignore case when matching features with affect.pattern; see grep . Default is FALSE.
affect.pattern.perl	[logical(1)] Use Perl-style regular expressions for affect.pattern; see grep . Default is FALSE.
affect.pattern.fixed	[logical(1)] Use fixed matching instead of regular expressions for affect.pattern; see grep . Default is FALSE.

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to `Tasks`, `data.frames`, `link{Learner}`s and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function `setHyperPars`. The other hyper-parameter manipulating functions, `getHyperPars` and `getParamSet` similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as prefix; this will, however, not change the parameters of the creator function.

 cpoFilterInformationGain

Filter Features: "information.gain"

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Filter "information.gain" uses the entropy-based information gain between each feature and target individually as an importance measure.

Usage

```
cpoFilterInformationGain(
  perc = NULL,
  abs = NULL,
  threshold = NULL,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

perc	[numeric(1)] If set, select perc*100 top scoring features. Mutually exclusive with arguments abs and threshold.
abs	[numeric(1)] If set, select abs top scoring features. Mutually exclusive with arguments perc and threshold.
threshold	[numeric(1)] If set, select features whose score exceeds threshold. Mutually exclusive with arguments perc and abs.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.

<code>export</code>	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values “export.all” (export all parameters), “export.default” (export all parameters that are exported by default), “export.set” (export all parameters that were set during construction), “export.default.set” (export the intersection of the “default” and “set” parameters), “export.unset” (export all parameters that were <i>not</i> set during construction) or “export.default.unset” (export the intersection of the “default” and “unset” parameters). Default is “export.default”.
<code>affect.type</code>	[character NULL] Type of columns to affect. A subset of “numeric”, “factor”, “ordered”, “other”, or NULL to not match by column type. Default is NULL.
<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the id parameter, and the affect.* parameters. The affect.* parameters enable the user to control which subset of a given dataset is affected. If no affect.* parameters are given, all data features are affected by default.

cpoFilterKruskal

Filter Features: “kruskal.test”

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Filter “kruskal.test” applies a Kruskal-Wallis rank sum test of the null hypothesis that the location parameters of the distribution of a feature are the same in each class and considers the test statistic as an variable importance measure: if the location parameters do not differ in at least one case, i.e., the null hypothesis cannot be rejected, there is little evidence that the corresponding feature is suitable for classification.

Usage

```

cpoFilterKruskal(
  perc = NULL,
  abs = NULL,
  threshold = NULL,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)

```

Arguments

perc	[numeric(1)] If set, select perc*100 top scoring features. Mutually exclusive with arguments abs and threshold.
abs	[numeric(1)] If set, select abs top scoring features. Mutually exclusive with arguments perc and threshold.
threshold	[numeric(1)] If set, select features whose score exceeds threshold. Mutually exclusive with arguments perc and abs.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Tar-

	get column indices are not counted (since target columns are always included). Default is <code>integer(0)</code> .
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is <code>character(0)</code> .
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

cpoFilterLinearCorrelation

Filter Features: "linear.correlation"

Description

This is a `CPOConstructor` to be used to create a `CPO`. It is called like any R function and returns the created `CPO`.

The Pearson correlation between each feature and the target is used as an indicator of feature importance. Rows with NA values are not taken into consideration.

Usage

```
cpoFilterLinearCorrelation(  
  perc = NULL,  
  abs = NULL,  
  threshold = NULL,  
  id,  
  export = "export.default",  
  affect.type = NULL,  
  affect.index = integer(0),  
  affect.names = character(0),  
  affect.pattern = NULL,  
  affect.invert = FALSE,  
  affect.pattern.ignore.case = FALSE,  
  affect.pattern.perl = FALSE,  
  affect.pattern.fixed = FALSE  
)
```

Arguments

perc	[numeric(1)] If set, select perc*100 top scoring features. Mutually exclusive with arguments abs and threshold.
abs	[numeric(1)] If set, select abs top scoring features. Mutually exclusive with arguments perc and threshold.
threshold	[numeric(1)] If set, select features whose score exceeds threshold. Mutually exclusive with arguments perc and abs.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
affect.invert	[logical(1)] Whether to affect all features <i>not</i> matched by other affect.* parameters.
affect.pattern.ignore.case	[logical(1)] Ignore case when matching features with affect.pattern; see grep . Default is FALSE.
affect.pattern.perl	[logical(1)] Use Perl-style regular expressions for affect.pattern; see grep . Default is FALSE.

```
affect.pattern.fixed
      [logical(1)]
      Use fixed matching instead of regular expressions for affect.pattern; see
      grep. Default is FALSE.
```

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), [data.frames](#), [link{Learner}s](#) and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the id parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

 cpoFilterMrmr

Filter Features: "mrmr"

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Minimum redundancy, maximum relevance filter "mrmr" computes the mutual information between the target and each individual feature minus the average mutual information of previously selected features and this feature using the **mRMRe** package.

Usage

```
cpoFilterMrmr(
  perc = NULL,
  abs = NULL,
  threshold = NULL,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

perc	[numeric(1)] If set, select perc*100 top scoring features. Mutually exclusive with arguments abs and threshold.
abs	[numeric(1)] If set, select abs top scoring features. Mutually exclusive with arguments perc and threshold.
threshold	[numeric(1)] If set, select features whose score exceeds threshold. Mutually exclusive with arguments perc and abs.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.

<code>export</code>	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values “export.all” (export all parameters), “export.default” (export all parameters that are exported by default), “export.set” (export all parameters that were set during construction), “export.default.set” (export the intersection of the “default” and “set” parameters), “export.unset” (export all parameters that were <i>not</i> set during construction) or “export.default.unset” (export the intersection of the “default” and “unset” parameters). Default is “export.default”.
<code>affect.type</code>	[character NULL] Type of columns to affect. A subset of “numeric”, “factor”, “ordered”, “other”, or NULL to not match by column type. Default is NULL.
<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

cpoFilterOneR

Filter Features: “oneR”

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Filter “oneR” makes use of a simple “One-Rule” (OneR) learner to determine feature importance. For this purpose the OneR learner generates one simple association rule for each feature in the data individually and computes the total error. The lower the error value the more important the corresponding feature.

Usage

```

cpoFilterOneR(
  perc = NULL,
  abs = NULL,
  threshold = NULL,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)

```

Arguments

perc	[numeric(1)] If set, select perc*100 top scoring features. Mutually exclusive with arguments abs and threshold.
abs	[numeric(1)] If set, select abs top scoring features. Mutually exclusive with arguments perc and threshold.
threshold	[numeric(1)] If set, select features whose score exceeds threshold. Mutually exclusive with arguments perc and abs.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Tar-

	get column indices are not counted (since target columns are always included). Default is <code>integer(0)</code> .
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is <code>character(0)</code> .
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

Value

[CPO](#) .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

cpoFilterPermutationImportance

Filter Features: "permutation.importance"

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Filter "permutation.importance" computes a loss function between predictions made by a learner before and after a feature is permuted.

Usage

```
cpoFilterPermutationImportance(
  perc = NULL,
  abs = NULL,
  threshold = NULL,
  imp.learner,
  contrast = function(x, y) {
    x - y
  },
  measure = NULL,
  aggregation = function(x, ...) UseMethod("mean"),
  nmc = 50,
  replace = FALSE,
  id,
  export = "export.default",
  affect.type = NULL,
```

```

affect.index = integer(0),
affect.names = character(0),
affect.pattern = NULL,
affect.invert = FALSE,
affect.pattern.ignore.case = FALSE,
affect.pattern.perl = FALSE,
affect.pattern.fixed = FALSE
)

```

Arguments

perc	[numeric(1)] If set, select perc*100 top scoring features. Mutually exclusive with arguments abs and threshold.
abs	[numeric(1)] If set, select abs top scoring features. Mutually exclusive with arguments perc and threshold.
threshold	[numeric(1)] If set, select features whose score exceeds threshold. Mutually exclusive with arguments perc and abs.
imp.learner	[Learner character(1)] Specifies the learner to use when computing the permutation importance.
contrast	[function] Contrast: takes two numeric vectors and returns one (default is the difference).
measure	[Measure] Measure to use. Defaults to the default measure of the task.
aggregation	[function] Aggregation: takes a numeric and returns a numeric(1) (default is the mean).
nmc	[integer(1)]
replace	[logical(1)] Determines whether the feature being permuted is sampled with or without replacement.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".

<code>affect.type</code>	[character NULL] Type of columns to affect. A subset of “numeric”, “factor”, “ordered”, “other”, or NULL to not match by column type. Default is NULL.
<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

cpoFilterRankCorrelation

Filter Features: "rank.correlation"

Description

This is a `CPOConstructor` to be used to create a `CPO`. It is called like any R function and returns the created `CPO`.

The Spearman correlation between each feature and the target is used as an indicator of feature importance. Rows with NA values are not taken into consideration.

Usage

```
cpoFilterRankCorrelation(
  perc = NULL,
  abs = NULL,
  threshold = NULL,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
```

```

    affect.pattern.per1 = FALSE,
    affect.pattern.fixed = FALSE
  )

```

Arguments

perc	[numeric(1)] If set, select perc*100 top scoring features. Mutually exclusive with arguments abs and threshold.
abs	[numeric(1)] If set, select abs top scoring features. Mutually exclusive with arguments perc and threshold.
threshold	[numeric(1)] If set, select features whose score exceeds threshold. Mutually exclusive with arguments perc and abs.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
affect.invert	[logical(1)] Whether to affect all features <i>not</i> matched by other affect.* parameters.
affect.pattern.ignore.case	[logical(1)] Ignore case when matching features with affect.pattern; see grep . Default is FALSE.

```

affect.pattern.perl
    [logical(1)]
    Use Perl-style regular expressions for affect.pattern; see grep. Default is
    FALSE.
affect.pattern.fixed
    [logical(1)]
    Use fixed matching instead of regular expressions for affect.pattern; see
    grep. Default is FALSE.

```

cpoFilterRelief *Filter Features: "relief"*

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Filter "relief" is based on the feature selection algorithm "ReliefF" by Kononenko et al., which is a generalization of the original "Relief" algorithm originally proposed by Kira and Rendell. Feature weights are initialized with zeros. Then for each instance `sample.size` instances are sampled, `neighbours.count` nearest-hit and nearest-miss neighbours are computed and the weight vector for each feature is updated based on these values.

Usage

```
cpoFilterRelief(
  perc = NULL,
  abs = NULL,
  threshold = NULL,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

perc	[numeric(1)] If set, select perc*100 top scoring features. Mutually exclusive with arguments abs and threshold.
abs	[numeric(1)] If set, select abs top scoring features. Mutually exclusive with arguments perc and threshold.
threshold	[numeric(1)] If set, select features whose score exceeds threshold. Mutually exclusive with arguments perc and abs.

id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
affect.invert	[logical(1)] Whether to affect all features <i>not</i> matched by other affect.* parameters.
affect.pattern.ignore.case	[logical(1)] Ignore case when matching features with affect.pattern; see grep . Default is FALSE.
affect.pattern.perl	[logical(1)] Use Perl-style regular expressions for affect.pattern; see grep . Default is FALSE.
affect.pattern.fixed	[logical(1)] Use fixed matching instead of regular expressions for affect.pattern; see grep . Default is FALSE.

 cpoFilterRfCImportance

Filter Features: “cforest.importance”

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Permutation importance of random forests fitted in package **party**. The implementation follows the principle of mean decrease in accuracy used by the **randomForest** package (see description of “randomForest.importance”) filter.

Usage

```
cpoFilterRfCImportance(
  mtry = 5,
  perc = NULL,
  abs = NULL,
  threshold = NULL,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

mtry	[integer(1)] Number of features to draw during feature bagging
perc	[numeric(1)] If set, select perc*100 top scoring features. Mutually exclusive with arguments abs and threshold.
abs	[numeric(1)] If set, select abs top scoring features. Mutually exclusive with arguments perc and threshold.
threshold	[numeric(1)] If set, select features whose score exceeds threshold. Mutually exclusive with arguments perc and abs.

id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
affect.invert	[logical(1)] Whether to affect all features <i>not</i> matched by other affect.* parameters.
affect.pattern.ignore.case	[logical(1)] Ignore case when matching features with affect.pattern; see grep . Default is FALSE.
affect.pattern.perl	[logical(1)] Use Perl-style regular expressions for affect.pattern; see grep . Default is FALSE.
affect.pattern.fixed	[logical(1)] Use fixed matching instead of regular expressions for affect.pattern; see grep . Default is FALSE.

`cpoFilterRfImportance` *Filter Features: “randomForest.importance”*

Description

This is a `CPOConstructor` to be used to create a `CPO`. It is called like any R function and returns the created `CPO`.

Filter “randomForest.importance” makes use of the `importance` from package `randomForest`. The importance measure to use is selected via the method parameter:

oob.accuracy Permutation of Out of Bag (OOB) data.

node.impurity Total decrease in node impurity.

Usage

```

cpoFilterRfImportance(
  perc = NULL,
  abs = NULL,
  threshold = NULL,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)

```

Arguments

perc	[numeric(1)] If set, select perc*100 top scoring features. Mutually exclusive with arguments abs and threshold.
abs	[numeric(1)] If set, select abs top scoring features. Mutually exclusive with arguments perc and threshold.
threshold	[numeric(1)] If set, select features whose score exceeds threshold. Mutually exclusive with arguments perc and abs.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Tar-

	get column indices are not counted (since target columns are always included). Default is <code>integer(0)</code> .
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is <code>character(0)</code> .
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

Value

[CPO](#) .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

cpoFilterRfSRCImportance

Filter Features: "randomForestSRC.rfsrc"

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Filter "randomForestSRC.rfsrc" computes the importance of random forests fitted in package **randomForestSRC**. The concrete method is selected via the method parameter. Possible values are permute (default), random, anti, permute.ensemble, random.ensemble, anti.ensemble. See the VIMP section in the docs for [rfsrc](#) for details.

Usage

```
cpoFilterRfSRCImportance(
  perc = NULL,
  abs = NULL,
  threshold = NULL,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

perc	[numeric(1)] If set, select perc*100 top scoring features. Mutually exclusive with arguments abs and threshold.
abs	[numeric(1)] If set, select abs top scoring features. Mutually exclusive with arguments perc and threshold.
threshold	[numeric(1)] If set, select features whose score exceeds threshold. Mutually exclusive with arguments perc and abs.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
affect.invert	[logical(1)] Whether to affect all features <i>not</i> matched by other affect.* parameters.
affect.pattern.ignore.case	[logical(1)] Ignore case when matching features with affect.pattern; see grep . Default is FALSE.
affect.pattern.perl	[logical(1)] Use Perl-style regular expressions for affect.pattern; see grep . Default is FALSE.

```

affect.pattern.fixed
      [logical(1)]
Use fixed matching instead of regular expressions for affect.pattern; see
grep. Default is FALSE.

```

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to `Tasks`, `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function `setHyperPars`. The other hyper-parameter manipulating functions, `getHyperPars` and `getParamSet` similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the id parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

cpoFilterRfSRCMinDepth

Filter Features: "randomForestSRC.var.select"

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Filter "randomForestSRC.var.select" uses the minimal depth variable selection proposed by Ishwaran et al. (2010) (method = "md") or a variable hunting approach (method = "vh" or method = "vh.vimp"). The minimal depth measure is the default.

Usage

```
cpoFilterRfSRCMinDepth(
  perc = NULL,
  abs = NULL,
  threshold = NULL,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

perc	[numeric(1)] If set, select perc*100 top scoring features. Mutually exclusive with arguments abs and threshold.
abs	[numeric(1)] If set, select abs top scoring features. Mutually exclusive with arguments perc and threshold.
threshold	[numeric(1)] If set, select features whose score exceeds threshold. Mutually exclusive with arguments perc and abs.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.

<code>export</code>	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values “export.all” (export all parameters), “export.default” (export all parameters that are exported by default), “export.set” (export all parameters that were set during construction), “export.default.set” (export the intersection of the “default” and “set” parameters), “export.unset” (export all parameters that were <i>not</i> set during construction) or “export.default.unset” (export the intersection of the “default” and “unset” parameters). Default is “export.default”.
<code>affect.type</code>	[character NULL] Type of columns to affect. A subset of “numeric”, “factor”, “ordered”, “other”, or NULL to not match by column type. Default is NULL.
<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

`cpoFilterSymmetricalUncertainty`

Filter Features: “symmetrical.uncertainty”

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Filter “symmetrical.uncertainty” uses the entropy-based symmetrical uncertainty between each feature and target individually as an importance measure.

Usage

```

cpoFilterSymmetricalUncertainty(
  perc = NULL,
  abs = NULL,
  threshold = NULL,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)

```

Arguments

perc	[numeric(1)] If set, select perc*100 top scoring features. Mutually exclusive with arguments abs and threshold.
abs	[numeric(1)] If set, select abs top scoring features. Mutually exclusive with arguments perc and threshold.
threshold	[numeric(1)] If set, select features whose score exceeds threshold. Mutually exclusive with arguments perc and abs.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Tar-

	get column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
affect.invert	[logical(1)] Whether to affect all features <i>not</i> matched by other affect.* parameters.
affect.pattern.ignore.case	[logical(1)] Ignore case when matching features with affect.pattern; see grep. Default is FALSE.
affect.pattern.perl	[logical(1)] Use Perl-style regular expressions for affect.pattern; see grep. Default is FALSE.
affect.pattern.fixed	[logical(1)] Use fixed matching instead of regular expressions for affect.pattern; see grep. Default is FALSE.

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to `Tasks`, `data.frames`, `link{Learner}s` and other CPO objects using the `%>>%` operator.

The parameters of this object can be changed after creation using the function `setHyperPars`. The other hyper-parameter manipulating functions, `getHyperPars` and `getParamSet` similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

cpoFilterUnivariate *Filter Features: "univariate.model.score"*

Description

This is a **CPOConstructor** to be used to create a **CPO**. It is called like any R function and returns the created **CPO**.

The "univariate.model.score" feature filter resamples an **mlr** learner specified via `perf.learner` for each feature individually with `randomForest` from package **rpart** being the default learner. Further parameter are the resampling strategy `perf.resampling` and the performance measure `perf.measure`.

Usage

```
cpoFilterUnivariate(
  perc = NULL,
  abs = NULL,
  threshold = NULL,
  perf.learner = NULL,
  perf.measure = NULL,
  perf.resampling = NULL,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
```

```

affect.pattern.ignore.case = FALSE,
affect.pattern.per1 = FALSE,
affect.pattern.fixed = FALSE
)

```

Arguments

perc	[numeric(1)] If set, select perc*100 top scoring features. Mutually exclusive with arguments abs and threshold.
abs	[numeric(1)] If set, select abs top scoring features. Mutually exclusive with arguments perc and threshold.
threshold	[numeric(1)] If set, select features whose score exceeds threshold. Mutually exclusive with arguments perc and abs.
perf.learner	[Learner NULL] Learner to resample. If this is NULL, <code>regr.randomForest</code> is used. Default is NULL.
perf.measure	[Measure NULL] Measure to use for resampling. If this is NULL, the Task's default Measure is used. Default is NULL.
perf.resampling	[ResampleDesc or ResampleInstance] Resampling strategy to use. If this is NULL, 2/3 holdout resampling is used. Default is NULL.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is <code>integer(0)</code> .

<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is <code>character(0)</code> .
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

`cpoFilterVariance` *Filter Features: "variance"*

Description

This is a `CPOConstructor` to be used to create a `CPO`. It is called like any R function and returns the created `CPO`.

Simple filter based on the variance of the features independent of each other. Features with higher variance are considered more important than features with low importance.

Usage

```
cpoFilterVariance(
  perc = NULL,
  abs = NULL,
  threshold = NULL,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

`perc` `[numeric(1)]`
 If set, select `perc*100` top scoring features. Mutually exclusive with arguments `abs` and `threshold`.

abs	[numeric(1)] If set, select abs top scoring features. Mutually exclusive with arguments perc and threshold.
threshold	[numeric(1)] If set, select features whose score exceeds threshold. Mutually exclusive with arguments perc and abs.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
affect.invert	[logical(1)] Whether to affect all features <i>not</i> matched by other affect.* parameters.
affect.pattern.ignore.case	[logical(1)] Ignore case when matching features with affect.pattern; see grep . Default is FALSE.
affect.pattern.perl	[logical(1)] Use Perl-style regular expressions for affect.pattern; see grep . Default is FALSE.
affect.pattern.fixed	[logical(1)] Use fixed matching instead of regular expressions for affect.pattern; see grep . Default is FALSE.

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to `Tasks`, `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function `setHyperPars`. The other hyper-parameter manipulating functions, `getHyperPars` and `getParamSet` similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as aprefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

 cpoFixFactors

Clean Up Factorial Features

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Prevent common pitfalls when using factorial data, by making factorial data have the same levels in training and prediction, and by dropping factor levels that do not occur in training data.

Usage

```
cpoFixFactors(
  drop.unused.levels = TRUE,
  fix.factors.prediction = TRUE,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

drop.unused.levels	Factor levels of data that have no instances in the data are dropped. If “fix.factors.prediction” is false, this can lead to training data having different factor levels than prediction data. Default is TRUE.
fix.factors.prediction	Factor levels are kept the same in training and prediction. This is recommended. Default is TRUE.
id	[character(1)] id to use as prefix for the CPO’s hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values “export.all” (export all parameters), “export.default” (export all parameters that are exported by default), “export.set” (export all parameters that were set during construction), “export.default.set” (export the intersection of the “default” and “set” parameters), “export.unset” (export all pa-

	rameters that were <i>not</i> set during construction) or “export.default.unset” (export the intersection of the “default” and “unset” parameters). Default is “export.default”.
affect.type	[character NULL] Type of columns to affect. A subset of “numeric”, “factor”, “ordered”, “other”, or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
affect.invert	[logical(1)] Whether to affect all features <i>not</i> matched by other affect.* parameters.
affect.pattern.ignore.case	[logical(1)] Ignore case when matching features with affect.pattern; see grep . Default is FALSE.
affect.pattern.perl	[logical(1)] Use Perl-style regular expressions for affect.pattern; see grep . Default is FALSE.
affect.pattern.fixed	[logical(1)] Use fixed matching instead of regular expressions for affect.pattern; see grep . Default is FALSE.

cpoIca

Construct a CPO for ICA Preprocessing

Description

This is a `CPOConstructor` to be used to create a `CPO`. It is called like any R function and returns the created `CPO`.

Use the `fastICA` function implementing the “FastICA algorithm”. See the documentation there.

Usage

```
cpoIca(
  n.comp = NULL,
  alg.typ = "parallel",
  fun = "logcosh",
  alpha = 1,
  method = "C",
  maxit = 200,
  tol = 1e-04,
  verbose = FALSE,
  id,
  export = "export.default",
  affect.type = NULL,
```

```

affect.index = integer(0),
affect.names = character(0),
affect.pattern = NULL,
affect.invert = FALSE,
affect.pattern.ignore.case = FALSE,
affect.pattern.perl = FALSE,
affect.pattern.fixed = FALSE
)

```

Arguments

n.comp	[numeric(1) NULL] Number of components to extract. Default is NULL, which sets it to the number of available numeric columns.
alg.typ	[character(1)] Algorithm type. One of “parallel” (default) or “deflation”.
fun	[character(1)] One of “logcosh” (default) or “exp”.
alpha	[numeric(1)] In range [1, 2], Used for negentropy calculation when fun is “logcosh”. Default is 1.0.
method	[character(1)] Internal calculation method. “C” (default) or “R”.
maxit	[numeric(1)] Maximum number of iterations. Default is 200.
tol	[numeric(1)] Tolerance for convergence, default is 1e-4.
verbose	[logical(1)] Default is FALSE.
id	[character(1)] id to use as prefix for the CPO’s hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values “export.all” (export all parameters), “export.default” (export all parameters that are exported by default), “export.set” (export all parameters that were set during construction), “export.default.set” (export the intersection of the “default” and “set” parameters), “export.unset” (export all parameters that were <i>not</i> set during construction) or “export.default.unset” (export the intersection of the “default” and “unset” parameters). Default is “export.default”.
affect.type	[character NULL] Type of columns to affect. A subset of “numeric”, “factor”, “ordered”, “other”, or NULL to not match by column type. Default is NULL.

<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is <code>integer(0)</code> .
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is <code>character(0)</code> .
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

Value

[CPO](#) .

CPOTrained State

The state contains a `$control` slot with the `$K`, `$W` and `$A` slots of the [fastICA](#) call, as well as a `$center` slot indicating the row-wise center of the training data that will be subtracted before rotation.

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}`s and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

cpoImpactEncodeClassif

Impact Encoding

Description

This is a **CPOConstructor** to be used to create a **CPO**. It is called like any R function and returns the created **CPO**.

Impact coding converts factor levels of each (factorial) column to the difference between each target level’s conditional log-likelihood given this level, and the target level’s global log-likelihood.

Usage

```
cpoImpactEncodeClassif(
  smoothing = 1e-04,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
```

```

    affect.pattern.perl = FALSE,
    affect.pattern.fixed = FALSE
  )

```

Arguments

smoothing	[numeric(1)] A finite positive value used for smoothing. Mostly relevant if a factor does not coincide with a target factor level (and would otherwise give an infinite logit value). Default is 1e-4.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
affect.invert	[logical(1)] Whether to affect all features <i>not</i> matched by other affect.* parameters.
affect.pattern.ignore.case	[logical(1)] Ignore case when matching features with affect.pattern; see grep . Default is FALSE.
affect.pattern.perl	[logical(1)] Use Perl-style regular expressions for affect.pattern; see grep . Default is FALSE.

```
affect.pattern.fixed
      [logical(1)]
      Use fixed matching instead of regular expressions for affect.pattern; see
      grep. Default is FALSE.
```

Value

[CPO](#) .

CPOTrained State

The state's `$control` slot is a list of matrices for each factorial data column. Each of these matrices has rows for each of the data column's levels, and columns for each of the target factor levels, and gives the respective impact values.

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}`s and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the "id" parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional "special" optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

 cpoImpactEncodeRegr *Impact Encoding*

Description

This is a `CPOConstructor` to be used to create a `CPO`. It is called like any R function and returns the created `CPO`.

Impact coding converts factor levels of each (factorial) column to the difference between the target's conditional mean given this level, and the target's global mean.

Usage

```
cpoImpactEncodeRegr(
  smoothing = 1e-04,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.per1 = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

smoothing	[numeric(1)] A finite positive value used for smoothing. Default is 1e-4.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.

<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is <code>integer(0)</code> .
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is <code>character(0)</code> .
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

Value

[CPO](#) .

CPOTrained State

The state's `$control` slot is a list of vectors for each factorial data column. Each of these vectors has an entry for each of the the data column's levels, and gives the respective impact value.

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functins, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the "id" parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional "special" optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

cpoImpute

Impute and Re-Impute Data

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Allows imputation of missing feature values through various techniques. Note that you have the possibility to re-impute a data set in the same way as the imputation was performed during training. This especially comes in handy during resampling when one wants to perform the same imputation on the test set as on the training set.

The function `impute` performs the imputation on a data set and returns, alongside with the imputed data set, an “ImputationDesc” object which can contain “learned” coefficients and helpful data. It can then be passed together with a new data set to [reimpute](#).

The imputation techniques can be specified for certain features or for feature classes, see function arguments.

You can either provide an arbitrary object, use a built-in imputation method listed under [imputations](#) or create one yourself using [makeImputeMethod](#).

`cpoImpute` will impute some columns. `cpoImputeAll` behaves just like `cpoImpute`, except that it will throw an error if there are any missings remaining in its output. `cpoImputeAll` should be used if one wants to prepend an imputer to a learner.

Usage

```
cpoImpute(
  target.cols = character(0),
  classes = list(),
  cols = list(),
  dummy.classes = character(0),
```

```

dummy.cols = character(0),
dummy.type = "factor",
force.dummies = FALSE,
impute.new.levels = TRUE,
recode.factor.levels = TRUE,
id,
export = "export.default",
affect.type = NULL,
affect.index = integer(0),
affect.names = character(0),
affect.pattern = NULL,
affect.invert = FALSE,
affect.pattern.ignore.case = FALSE,
affect.pattern.per1 = FALSE,
affect.pattern.fixed = FALSE
)

cpoImputeAll(
  target.cols = character(0),
  classes = list(),
  cols = list(),
  dummy.classes = character(0),
  dummy.cols = character(0),
  dummy.type = "factor",
  force.dummies = FALSE,
  impute.new.levels = TRUE,
  recode.factor.levels = TRUE,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.per1 = FALSE,
  affect.pattern.fixed = FALSE
)

```

Arguments

<code>target.cols</code>	[character] Name of the column(s) specifying the response. Default is <code>character(0)</code> .
<code>classes</code>	[named list] Named list containing imputation techniques for classes of columns. E.g. <code>list(numeric = imputeMedian())</code> .
<code>cols</code>	[named list] Named list containing names of imputation methods to impute missing values

	in the data column referenced by the list element's name. Overrides imputation set via classes.
<code>dummy.classes</code>	[character] Classes of columns to create dummy columns for. Default is <code>character(0)</code> .
<code>dummy.cols</code>	[character] Column names to create dummy columns (containing binary missing indicator) for. Default is <code>character(0)</code> .
<code>dummy.type</code>	[character(1)] How dummy columns are encoded. Either as 0/1 with type "numeric" or as "factor". Default is "factor".
<code>force.dummies</code>	[logical(1)] Force dummy creation even if the respective data column does not contain any NAs. Note that (a) most learners will complain about constant columns created this way but (b) your feature set might be stochastic if you turn this off. Default is FALSE.
<code>impute.new.levels</code>	[logical(1)] If new, unencountered factor level occur during reimputation, should these be handled as NAs and then be imputed the same way? Default is TRUE.
<code>recode.factor.levels</code>	[logical(1)] Recode factor levels after reimputation, so they match the respective element of <code>lvls</code> (in the description object) and therefore match the levels of the feature factor in the training data after imputation?. Default is TRUE.
<code>id</code>	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
<code>export</code>	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
<code>affect.type</code>	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is <code>integer(0)</code> .
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is <code>character(0)</code> .

affect.pattern [character(1) | NULL]
[grep](#) pattern to match feature names by. Default is NULL (no pattern matching)

affect.invert [logical(1)]
 Whether to affect all features *not* matched by other `affect.*` parameters.

affect.pattern.ignore.case
 [logical(1)]
 Ignore case when matching features with `affect.pattern`; see [grep](#). Default is FALSE.

affect.pattern.perl
 [logical(1)]
 Use Perl-style regular expressions for `affect.pattern`; see [grep](#). Default is FALSE.

affect.pattern.fixed
 [logical(1)]
 Use fixed matching instead of regular expressions for `affect.pattern`; see [grep](#). Default is FALSE.

Details

The description object contains these slots

target [character] See argument.

features [character] Feature names (column names of data),.

classes [character] Feature classes (storage type of data).

lvls [named list] Mapping of column names of factor features to their levels, including newly created ones during imputation.

impute [named list] Mapping of column names to imputation functions.

dummies [named list] Mapping of column names to imputation functions.

impute.new.levels [logical(1)] See argument.

recode.factor.levels [logical(1)] See argument.

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to `Tasks`, `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function `setHyperPars`. The other hyper-parameter manipulating functions, `getHyperPars` and `getParamSet` similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

Other imputation CPOs: `cpoImputeConstant()`, `cpoImputeHist()`, `cpoImputeLearner()`, `cpoImputeMax()`, `cpoImputeMean()`, `cpoImputeMedian()`, `cpoImputeMin()`, `cpoImputeMode()`, `cpoImputeNormal()`, `cpoImputeUniform()`

cpoImputeConstant

Perform Imputation with Constant Value

Description

Allows imputation of missing feature values through various techniques. Note that you have the possibility to re-impute a data set in the same way as the imputation was performed during training. This especially comes in handy during resampling when one wants to perform the same imputation on the test set as on the training set.

Usage

```
cpoImputeConstant(
  const,
  impute.new.levels = TRUE,
  recode.factor.levels = TRUE,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
```

```

affect.names = character(0),
affect.pattern = NULL,
affect.invert = FALSE,
affect.pattern.ignore.case = FALSE,
affect.pattern.perl = FALSE,
affect.pattern.fixed = FALSE
)

```

Arguments

const	[any] Constant valued use for imputation.
impute.new.levels	[logical(1)] If new, unencountered factor level occur during reimputation, should these be handled as NAs and then be imputed the same way? Default is TRUE.
recode.factor.levels	[logical(1)] Recode factor levels after reimputation, so they match the respective element of lvl1s (in the description object) and therefore match the levels of the feature factor in the training data after imputation?. Default is TRUE.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)

`affect.invert` [logical(1)]
 Whether to affect all features *not* matched by other `affect.*` parameters.

`affect.pattern.ignore.case`
 [logical(1)]
 Ignore case when matching features with `affect.pattern`; see [grep](#). Default is FALSE.

`affect.pattern.perl`
 [logical(1)]
 Use Perl-style regular expressions for `affect.pattern`; see [grep](#). Default is FALSE.

`affect.pattern.fixed`
 [logical(1)]
 Use fixed matching instead of regular expressions for `affect.pattern`; see [grep](#). Default is FALSE.

Details

The description object contains these slots

target [character] See argument.

features [character] Feature names (column names of data),.

classes [character] Feature classes (storage type of data).

Other CPOs: `cpoApplyFunRegrTarget()`, `cpoApplyFun()`, `cpoAsNumeric()`, `cpoCache()`, `cpoCbind()`, `cpoCollapseFact()`, `cpoDropConstants()`, `cpoDropMostlyConstants()`, `cpoDummyEncode()`, `cpoFilterAnova()`, `cpoFilterCarscore()`, `cpoFilterChiSquared()`, `cpoFilterFeatures()`, `cpoFilterGainRatio()`, `cpoFilterInformationGain()`, `cpoFilterKruskal()`, `cpoFilterLinearCorrelation()`, `cpoFilterMrmr()`, `cpoFilterOneR()`, `cpoFilterPermutationImportance()`, `cpoFilterRankCorrelation()`, `cpoFilterRelief()`, `cpoFilterRfCImportance()`, `cpoFilterRfImportance()`, `cpoFilterRfSRCImportance()`, `cpoFilterRfSRCMinDepth()`, `cpoFilterSymmetricalUncertainty()`, `cpoFilterUnivariate()`, `cpoFilterVariance()`, `cpoFixFactors()`, `cpoIca()`, `cpoImpactEncodeClassif()`, `cpoImpactEncodeRegr()`, `cpoImputeHist()`, `cpoImputeLearner()`, `cpoImputeMax()`, `cpoImputeMean()`, `cpoImputeMedian()`, `cpoImputeMin()`, `cpoImputeMode()`, `cpoImputeNormal()`, `cpoImputeUniform()`, `cpoImpute()`, `cpoLogTrafoRegr()`, `cpoMakeCols()`, `cpoMissingIndicators()`, `cpoModelMatrix()`, `cpoOversample()`, `cpoPca()`, `cpoProbEncode()`, `cpoQuantileBinNumerics()`, `cpoRegrResiduals()`, `cpoResponseFromSE()`, `cpoSample()`, `cpoScaleMaxAbs()`, `cpoScaleRange()`, `cpoScale()`, `cpoSelect()`, `cpoSmote()`, `cpoSpatialSign()`, `cpoTransformParams()`, `cpoWrap()`, `makeCPOCase()`, `makeCPOMultiplex()`

cpoImputeHist

Perform Imputation with Random Values

Description

Allows imputation of missing feature values through various techniques. Note that you have the possibility to re-impute a data set in the same way as the imputation was performed during training. This especially comes in handy during resampling when one wants to perform the same imputation on the test set as on the training set.

This imputation method imputes with random values drawn from a distribution that approximates the data distribution as a histogram.

Usage

```
cpoImputeHist(
  breaks = "Sturges",
  use.mids = TRUE,
  impute.new.levels = TRUE,
  recode.factor.levels = TRUE,
  id,
```

```

export = "export.default",
affect.type = NULL,
affect.index = integer(0),
affect.names = character(0),
affect.pattern = NULL,
affect.invert = FALSE,
affect.pattern.ignore.case = FALSE,
affect.pattern.perl = FALSE,
affect.pattern.fixed = FALSE
)

```

Arguments

breaks	[numeric(1) "Sturges"] Number of breaks to use in <code>hist</code> . Defaults to auto-detection via "Sturges".
use.mids	[logical(1)] If <code>x</code> is numeric and a histogram is used, impute with bin mids (default) or instead draw uniformly distributed samples within bin range.
impute.new.levels	[logical(1)] If new, unencountered factor level occur during reimputation, should these be handled as NAs and then be imputed the same way? Default is TRUE.
recode.factor.levels	[logical(1)] Recode factor levels after reimputation, so they match the respective element of <code>lvls</code> (in the description object) and therefore match the levels of the feature factor in the training data after imputation?. Default is TRUE.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is <code>integer(0)</code> .

<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is <code>character(0)</code> .
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

cpoImputeLearner

Perform Imputation with an mlr Learner

Description

Allows imputation of missing feature values through various techniques. Note that you have the possibility to re-impute a data set in the same way as the imputation was performed during training. This especially comes in handy during resampling when one wants to perform the same imputation on the test set as on the training set.

Usage

```
cpoImputeLearner(
  learner,
  features = NULL,
  impute.new.levels = TRUE,
  recode.factor.levels = TRUE,
  id,
  export = "export.default",
  affect.type = NULL,
```

```

affect.index = integer(0),
affect.names = character(0),
affect.pattern = NULL,
affect.invert = FALSE,
affect.pattern.ignore.case = FALSE,
affect.pattern.perl = FALSE,
affect.pattern.fixed = FALSE
)

```

Arguments

learner	[Learner character(1)] Supervised learner. Its predictions will be used for imputations. If you pass a string the learner will be created via makeLearner . Note that the target column is not available for this operation.
features	[character] Features to use in learner for prediction. Default is NULL which uses all available features except the target column of the original task.
impute.new.levels	[logical(1)] If new, unencountered factor level occur during reimputation, should these be handled as NAs and then be imputed the same way? Default is TRUE.
recode.factor.levels	[logical(1)] Recode factor levels after reimputation, so they match the respective element of lvl1s (in the description object) and therefore match the levels of the feature factor in the training data after imputation?. Default is TRUE.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).

<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is <code>character(0)</code> .
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

Details

The description object contains these slots

target [character] See argument.

features [character] Feature names (column names of data),.

classes [character] Feature classes (storage type of data).

lvls [named list] Mapping of column names of factor features to their levels, including newly created ones during imputation.

impute [named list] Mapping of column names to imputation functions.

dummies [named list] Mapping of column names to imputation functions.

impute.new.levels [logical(1)] See argument.

recode.factor.levels [logical(1)] See argument.

Value

[CPO](#) .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}`s and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

Other CPOs: `cpoApplyFunRegrTarget()`, `cpoApplyFun()`, `cpoAsNumeric()`, `cpoCache()`, `cpoCbind()`, `cpoCollapseFact()`, `cpoDropConstants()`, `cpoDropMostlyConstants()`, `cpoDummyEncode()`, `cpoFilterAnova()`, `cpoFilterCarscore()`, `cpoFilterChiSquared()`, `cpoFilterFeatures()`, `cpoFilterGainRatio()`, `cpoFilterInformationGain()`, `cpoFilterKruskal()`, `cpoFilterLinearCorrelation()`, `cpoFilterMrmr()`, `cpoFilterOneR()`, `cpoFilterPermutationImportance()`, `cpoFilterRankCorrelation()`, `cpoFilterRelief()`, `cpoFilterRfCImportance()`, `cpoFilterRfImportance()`, `cpoFilterRfSRCImportance()`, `cpoFilterRfSRCMinDepth()`, `cpoFilterSymmetricalUncertainty()`, `cpoFilterUnivariate()`, `cpoFilterVariance()`, `cpoFixFactors()`, `cpoIca()`, `cpoImpactEncodeClassif()`, `cpoImpactEncodeRegr()`, `cpoImputeConstant()`, `cpoImputeHist()`, `cpoImputeMax()`, `cpoImputeMean()`, `cpoImputeMedian()`, `cpoImputeMin()`, `cpoImputeMode()`, `cpoImputeNormal()`, `cpoImputeUniform()`, `cpoImpute()`, `cpoLogTrafoRegr()`, `cpoMakeCols()`, `cpoMissingIndicators()`, `cpoModelMatrix()`, `cpoOversample()`, `cpoPca()`, `cpoProbEncode()`, `cpoQuantileBinNumerics()`, `cpoRegrResiduals()`, `cpoResponseFromSE()`, `cpoSample()`, `cpoScaleMaxAbs()`, `cpoScaleRange()`, `cpoScale()`, `cpoSelect()`, `cpoSmote()`, `cpoSpatialSign()`, `cpoTransformParams()`, `cpoWrap()`, `makeCPOCase()`, `makeCPOMultiplex()`

cpoImputeMax

Perform Imputation with Multiple of Minimum

Description

Allows imputation of missing feature values through various techniques. Note that you have the possibility to re-impute a data set in the same way as the imputation was performed during training. This especially comes in handy during resampling when one wants to perform the same imputation on the test set as on the training set.

This method imputes by the maximum value of each column, multiplied by a constant.

Usage

```
cpoImputeMax(
  multiplier = 1,
  impute.new.levels = TRUE,
  recode.factor.levels = TRUE,
  id,
  export = "export.default",
  affect.type = NULL,
```

```

affect.index = integer(0),
affect.names = character(0),
affect.pattern = NULL,
affect.invert = FALSE,
affect.pattern.ignore.case = FALSE,
affect.pattern.perl = FALSE,
affect.pattern.fixed = FALSE
)

```

Arguments

multiplier	[numeric(1)] Value that stored minimum or maximum is multiplied with when imputation is done.
impute.new.levels	[logical(1)] If new, unencountered factor level occur during reimputation, should these be handled as NAs and then be imputed the same way? Default is TRUE.
recode.factor.levels	[logical(1)] Recode factor levels after reimputation, so they match the respective element of lvl1s (in the description object) and therefore match the levels of the feature factor in the training data after imputation?. Default is TRUE.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).

affect.pattern [character(1) | NULL]
[grep](#) pattern to match feature names by. Default is NULL (no pattern matching)

affect.invert [logical(1)]
 Whether to affect all features *not* matched by other `affect.*` parameters.

affect.pattern.ignore.case
 [logical(1)]
 Ignore case when matching features with `affect.pattern`; see [grep](#). Default is FALSE.

affect.pattern.perl
 [logical(1)]
 Use Perl-style regular expressions for `affect.pattern`; see [grep](#). Default is FALSE.

affect.pattern.fixed
 [logical(1)]
 Use fixed matching instead of regular expressions for `affect.pattern`; see [grep](#). Default is FALSE.

Details

cpoImputeMean

Perform Imputation with Mean Value

Description

Allows imputation of missing feature values through various techniques. Note that you have the possibility to re-impute a data set in the same way as the imputation was performed during training. This especially comes in handy during resampling when one wants to perform the same imputation on the test set as on the training set.

Usage

```
cpoImputeMean(
  impute.new.levels = TRUE,
  recode.factor.levels = TRUE,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
```

```

affect.pattern = NULL,
affect.invert = FALSE,
affect.pattern.ignore.case = FALSE,
affect.pattern.perl = FALSE,
affect.pattern.fixed = FALSE
)

```

Arguments

`impute.new.levels` [logical(1)]
If new, unencountered factor level occur during reimputation, should these be handled as NAs and then be imputed the same way? Default is TRUE.

`recode.factor.levels` [logical(1)]
Recode factor levels after reimputation, so they match the respective element of lvls (in the description object) and therefore match the levels of the feature factor in the training data after imputation?. Default is TRUE.

`id` [character(1)]
id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.

`export` [character]
Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were *not* set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".

`affect.type` [character | NULL]
Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.

`affect.index` [numeric]
Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).

`affect.names` [character]
Feature names of feature columns to affect. The order of names given is respected. Default is character(0).

`affect.pattern` [character(1) | NULL]
[grep](#) pattern to match feature names by. Default is NULL (no pattern matching)

`affect.invert` [logical(1)]
Whether to affect all features *not* matched by other `affect.*` parameters.

`affect.pattern.ignore.case`
 [logical(1)]
 Ignore case when matching features with `affect.pattern`; see [grep](#). Default is FALSE.

`affect.pattern.perl`
 [logical(1)]
 Use Perl-style regular expressions for `affect.pattern`; see [grep](#). Default is FALSE.

`affect.pattern.fixed`
 [logical(1)]
 Use fixed matching instead of regular expressions for `affect.pattern`; see [grep](#). Default is FALSE.

cpoImputeMedian

Perform Imputation with Median Value

Description

Allows imputation of missing feature values through various techniques. Note that you have the possibility to re-impute a data set in the same way as the imputation was performed during training. This especially comes in handy during resampling when one wants to perform the same imputation on the test set as on the training set.

Usage

```
cpoImputeMedian(
  impute.new.levels = TRUE,
  recode.factor.levels = TRUE,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

<code>impute.new.levels</code>	[logical(1)] If new, unencountered factor level occur during reimputation, should these be handled as NAs and then be imputed the same way? Default is TRUE.
<code>recode.factor.levels</code>	[logical(1)] Recode factor levels after reimputation, so they match the respective element of <code>lvls</code> (in the description object) and therefore match the levels of the feature factor in the training data after imputation?. Default is TRUE.
<code>id</code>	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOs with hyperparameters with clashing names.
<code>export</code>	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
<code>affect.type</code>	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

`affect.pattern.fixed`
 [logical(1)]
 Use fixed matching instead of regular expressions for `affect.pattern`; see [grep](#). Default is FALSE.

cpoImputeMin

Perform Imputation with Multiple of Minimum

Description

Allows imputation of missing feature values through various techniques. Note that you have the possibility to re-impute a data set in the same way as the imputation was performed during training. This especially comes in handy during resampling when one wants to perform the same imputation on the test set as on the training set.

This method imputes by the minimum value of each column, multiplied by a constant.

Usage

```

cpoImputeMin(
  multiplier = 1,
  impute.new.levels = TRUE,
  recode.factor.levels = TRUE,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)

```

Arguments

multiplier	[numeric(1)] Value that stored minimum or maximum is multiplied with when imputation is done.
------------	--

<code>impute.new.levels</code>	[logical(1)] If new, unencountered factor level occur during reimputation, should these be handled as NAs and then be imputed the same way? Default is TRUE.
<code>recode.factor.levels</code>	[logical(1)] Recode factor levels after reimputation, so they match the respective element of <code>lvls</code> (in the description object) and therefore match the levels of the feature factor in the training data after imputation?. Default is TRUE.
<code>id</code>	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
<code>export</code>	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
<code>affect.type</code>	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)]

Use fixed matching instead of regular expressions for `affect.pattern`; see [grep](#). Default is FALSE.

cpoImputeMode	<i>Perform Imputation with Mode Value</i>
---------------	---

Description

Allows imputation of missing feature values through various techniques. Note that you have the possibility to re-impute a data set in the same way as the imputation was performed during training. This especially comes in handy during resampling when one wants to perform the same imputation on the test set as on the training set.

Usage

```

cpoImputeMode(
  impute.new.levels = TRUE,
  recode.factor.levels = TRUE,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)

```

Arguments

```

impute.new.levels
  [logical(1)]
  If new, unencountered factor level occur during reimputation, should these be
  handled as NAs and then be imputed the same way? Default is TRUE.

recode.factor.levels
  [logical(1)]
  Recode factor levels after reimputation, so they match the respective element

```

	of lvls (in the description object) and therefore match the levels of the feature factor in the training data after imputation?. Default is TRUE.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
affect.invert	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
affect.pattern.ignore.case	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
affect.pattern.perl	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
affect.pattern.fixed	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

Details

The description object contains these slots

target [character] See argument.

features [character] Feature names (column names of data),
classes [character] Feature classes (storage type of data).
lvls [named list] Mapping of column names of factor features to their levels, including newly created ones during imputation.
impute [named list] Mapping of column names to imputation functions.
dummies [named list] Mapping of column names to imputation functions.
impute.new.levels [logical(1)] See argument.
recode.factor.levels [logical(1)] See argument.

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

cpoImputeNormal *Perform Imputation with Normally Distributed Random Values*

Description

Allows imputation of missing feature values through various techniques. Note that you have the possibility to re-impute a data set in the same way as the imputation was performed during training. This especially comes in handy during resampling when one wants to perform the same imputation on the test set as on the training set.

Usage

```
cpoImputeNormal(
  mu = NA_real_,
  sd = NA_real_,
  impute.new.levels = TRUE,
  recode.factor.levels = TRUE,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

mu	[numeric(1)] Mean of normal distribution. If missing it will be estimated from the data.
sd	[numeric(1)] Standard deviation of normal distribution. If missing it will be estimated from the data.
impute.new.levels	[logical(1)] If new, unencountered factor level occur during reimputation, should these be handled as NAs and then be imputed the same way? Default is TRUE.
recode.factor.levels	[logical(1)] Recode factor levels after reimputation, so they match the respective element of lvl's (in the description object) and therefore match the levels of the feature factor in the training data after imputation?. Default is TRUE.

<code>id</code>	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
<code>export</code>	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
<code>affect.type</code>	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

cpoImputeUniform *Perform Imputation with Uniformly Random Values*

Description

Allows imputation of missing feature values through various techniques. Note that you have the possibility to re-impute a data set in the same way as the imputation was performed during training. This especially comes in handy during resampling when one wants to perform the same imputation on the test set as on the training set.

Usage

```
cpoImputeUniform(
  min = NA_real_,
  max = NA_real_,
  impute.new.levels = TRUE,
  recode.factor.levels = TRUE,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.per1 = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

min	[numeric(1)] Lower bound for uniform distribution. If NA (default), it will be estimated from the data.
max	[numeric(1)] Upper bound for uniform distribution. If NA (default), it will be estimated from the data.
impute.new.levels	[logical(1)] If new, unencountered factor level occur during reimputation, should these be handled as NAs and then be imputed the same way? Default is TRUE.
recode.factor.levels	[logical(1)] Recode factor levels after reimputation, so they match the respective element of lvl\$ (in the description object) and therefore match the levels of the feature factor in the training data after imputation?. Default is TRUE.

<code>id</code>	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
<code>export</code>	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
<code>affect.type</code>	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

CPOLearner

*CPO Learner Object***Description**

CPO Learners are created when a [CPO](#) gets attached to an [mlr-Learner](#) object. The resulting learner performs the operation described by the attached [CPO](#) before fitting the model specified by the [Learner](#). It is possible to attach compound CPOs, and it is possible to attach more CPOs to a learner that is already a CPOLearner. If the attached CPO exports hyperparameters, these become part of the newly created learner and can be queried and set using functions such as [getParamSet](#), [getHyperPars](#), and [setHyperPars](#).

The model created when training a CPOLearner also contains the relevant [CPORetrafo](#) information to be applied to prediction data; this can be retrieved using [retrafo](#). The [CPOInverter](#) functionality is handled equally transparently by the model.

A CPOLearner can possibly have different [LearnerProperties](#) than the base [Learner](#) to which it is attached. This depends on the [CPO](#)'s properties, see [CPOProperties](#).

It is possible to retrieve the CPOLearner's base learner using [getLearnerBare](#), and to get the attached CPOs using [getLearnerCPO](#).

Other CPO lifecycle related: [CPOConstructor](#), [CPOTrained](#), [CPO](#), [NULLCPO](#), [%>>%\(\)](#), [attachCPO\(\)](#), [composeCPO\(\)](#), [getCPOClass\(\)](#), [getCPOConstructor\(\)](#), [getCPOTrainedCPO\(\)](#), [identicalCPO\(\)](#), [makeCPO\(\)](#)

Other CPOLearner related: [attachCPO\(\)](#), [getLearnerBare\(\)](#), [getLearnerCPO\(\)](#)

Examples

```
lrn = makeLearner("classif.logreg")
cpolrn = cpoScale() %>>% lrn
print(cpolrn)

getLearnerBare(cpolrn) # classif.logreg Learner
getLearnerCPO(cpolrn) # cpoScale() CPO

getParamSet(cpolrn) # includes cpoScale hyperparameters

model = train(cpolrn, pid.task) # behaves like a learner
retrafo(model) # the CPORetrafo that was trained

predict(model, pid.task) # otherwise behaves like an mlr model
```

cpoLogTrafoRegr

*Log-Transform a Regression Target Variable.***Description**

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Log-transforms the regression [Task](#)'s target variable.

If `predict.type` is "response" for inversion, the model's prediction is exponentiated.

If `predict.type` = "se" prediction is performed, the model's prediction is taken as the parameters of a lognormal random variable; the inverted prediction is then $\text{mean} = \exp(\text{mean} + \text{se}^2 / 2)$, $\text{se} = \sqrt{(\exp(\text{se}^2) - 1) * \exp(2 * \text{mean} + \text{se}^2)}$.

It is therefore recommended to use "se" prediction, possibly with the help of [cpoResponseFromSE](#).

Usage

```
cpoLogTrafoRegr(id)
```

Arguments

id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
----	---

Value

[CPO](#) .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the "id" parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

cpoMakeCols

Create Columns from Expressions

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Create columns from expressions and the incoming data.

When `cpoMakeCols` or `cpoAddCols` are called as `cpoMakeCols(<newcolname> = <expression>, ...)`, a new column with the name `<newcolname>` containing the result of `<expression>` is created. The expressions need to be vectorising R expressions and may refer to any feature columns in the data (excluding the target) and any other values. The names should be valid data.frame column names and may not clash with the target column name.

`cpoMakeCols` replaces existing cols by the newly created ones, `cpoAddCols` adds them to the data already present.

Usage

```
cpoMakeCols(..., .make.factors = TRUE)
```

```
cpoAddCols(..., .make.factors = TRUE)
```

Arguments

...	[any] Expressions of the form <code>colname = expr</code> . See Examples.
<code>.make.factors</code>	[logical(1)] Whether to turn resulting logical and character columns into factor columns (which are preferred by <code>mlr</code>). Default is TRUE.

Value

CPO .

CPOTrained State

The created state is empty.

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), data.frames, `link{Learner}s` and other CPO objects using the `%>>%` operator.

The parameters of this object can be changed after creation using the function `setHyperPars`. The other hyper-parameter manipulating functions, `getHyperPars` and `getParamSet` similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as aprefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the id parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

Examples

```
res = pid.task %>>% cpoAddCols(gpi = glucose * pressure * insulin, pm = pregnant * mass)
head(getTaskData(res))
```

cpoMissingIndicators *Convert Data into Factors Indicating Missing Data*

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Convert a `data.frame` into a `data.frame` with the same column names, but with columns of factors indicating whether data was missing or not.

This is most useful in combination with [cpoCbind](#).

Usage

```
cpoMissingIndicators(
  force.dummies = FALSE,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

<code>force.dummies</code>	[<code>logical(1)</code>] Whether to create dummy columns even for data that is not missing. This can be useful if missing data is expected during test in columns where it did not occur during training.
<code>id</code>	[<code>character(1)</code>] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOs with hyperparameters with clashing names.
<code>export</code>	[<code>character</code>] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".

<code>affect.type</code>	[character NULL] Type of columns to affect. A subset of “numeric”, “factor”, “ordered”, “other”, or NULL to not match by column type. Default is NULL.
<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. cpoModelMatrix

*Create a "Model Matrix" from the Data Given a Formula***Description**

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

This uses the "stats" function `model.matrix` to create (numerical) data from the given data, using the provided formula.

Usage

```
cpoModelMatrix(
  formula,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.per1 = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

formula	[formula] Formula to use. Higher order interactions can be created using constructs like <code>~. ^ 2</code> .
---------	---

<code>id</code>	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
<code>export</code>	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
<code>affect.type</code>	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}`s and other CPO objects using the `%>%` operator.

cpoOversample

Over- or Undersample Binary Classification Tasks

Description

This is a `CPOConstructor` to be used to create a `CPO`. It is called like any R function and returns the created `CPO`.

Oversamples the minor or undersamples the major class in a binary classification task to alleviate class imbalance. Uses `mlr::oversample` and `mlr::undersample`, see documentation there.

Usage

```
cpoOversample(rate = NULL, cl = NULL, id, export = "export.default")
```

```
cpoUndersample(rate = NULL, cl = NULL, id, export = "export.default")
```

Arguments

rate	[numeric(1) NULL] Factor to up- or downsample a class. Must be between 0 and 1 for undersampling and greater or equal 1 for oversampling. If this is NULL, this is the ratio of major to minor class prevalence (for oversampling, or the inverse for undersampling). Must not be NULL if c1 is not NULL and not the minor class for oversampling / the major class for undersampling. Default is NULL.
c1	[character(1) NULL] Class to over- or undersample. For NULL, the minor class for oversampling or the major class for undersampling is chosen automatically.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".

Value

cpoPca

*Construct a CPO for PCA Preprocessing***Description**

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Performs principal component analysis using [prcomp](#).

Usage

```
cpoPca(
  center = TRUE,
  scale = FALSE,
  tol = NULL,
  rank = NULL,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

center	[logical(1)] Whether to center columns before PCA. Default is TRUE.
scale	[logical(1)] Whether to scale columns to unit variance before PCA. Default is FALSE.
tol	[numeric(1) NULL] Magnitude below which components are omitted. Default is NULL: all columns returned. Sensible settings are $\text{tol} = 0$, $\text{tol} = \text{sqrt}(\text{.Machine}\$\text{double.eps})$.
rank	[numeric(1) NULL] Maximal number of components to return. Default is NULL, no limit.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
affect.invert	[logical(1)] Whether to affect all features <i>not</i> matched by other affect.* parameters.
affect.pattern.ignore.case	[logical(1)] Ignore case when matching features with affect.pattern; see grep . Default is FALSE.
affect.pattern.perl	[logical(1)] Use Perl-style regular expressions for affect.pattern; see grep . Default is FALSE.

```
affect.pattern.fixed
      [logical(1)]
      Use fixed matching instead of regular expressions for affect.pattern; see
      grep. Default is FALSE.
```

Value

[CPO](#) .

CPOTrained State

The state's `$control` slot is a list with the `$rotation` matrix, the `$scale` vector and the `$center` vector as returned by [prcomp](#).

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}`s and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

cpoProbEncode *Probability Encoding*

Description

This is a `CPOConstructor` to be used to create a `CPO`. It is called like any R function and returns the created `CPO`.

Converts factor columns into columns giving the probability for each target class to have this target, given the column value.

Usage

```
cpoProbEncode(
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.per1 = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

<code>id</code>	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOs with hyperparameters with clashing names.
<code>export</code>	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
<code>affect.type</code>	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).

<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is <code>character(0)</code> .
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

Value

CPO .

CPOTrained State

The state's `$control` slot is a list of matrices for each factorial data column. Each of these matrices has rows for each of the data column's levels, and columns for each of the target factor levels, and gives the empirical marginal conditional probabilities for each target value given the column value.

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the "id" parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional "special" optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

`cpoQuantileBinNumerics`

Split Numeric Features into Quantile Bins

Description

This is a `CPOConstructor` to be used to create a `CPO`. It is called like any R function and returns the created `CPO`.

Usage

```
cpoQuantileBinNumerics(
  numplits = 2,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

<code>numplits</code>	<code>[numeric(1)]</code> Number of bins to create. Default is 2.
-----------------------	--

<code>id</code>	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOs with hyperparameters with clashing names.
<code>export</code>	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
<code>affect.type</code>	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

cpoRegrResiduals

Train a Model on a Task and Return the Residual Task

Description

This is a `CPOConstructor` to be used to create a `CPO`. It is called like any R function and returns the created `CPO`.

Given a regression learner, this `CPO` fits the learner to a regression `Task` and replaces the regression target with the residuals—the differences of the target values and the model’s predictions—of the model.

For inversion, the predictions of the model for the prediction data are added to the predictions to be inverted.

If `predict.se` is `TRUE`, `property.type == "se"` inversion can also be performed. In that case, the `se` of the incoming prediction and the `se` of the internal model are assumed to be independently distributed, and the resulting `se` is the pythagorean sum of the `ses`.

Usage

```

cpoRegrResiduals(
  learner,
  predict.se = FALSE,
  crr.train.residuals = "plain",
  crr.resampling = cv5,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.per1 = FALSE,
  affect.pattern.fixed = FALSE
)

```

Arguments

learner	[character(1) Learner] A regression Learner , or a character(1) identifying a Learner to be constructed.
predict.se	[logical(1)] Whether to fit the model with “se” predict type. This enables the resulting CPOInverter to be used for property . type == “se” inversion. Default is FALSE.
crr.train.residuals	[character(1)] What residuals to use for training (i.e. initial transformation). One of “resample”, “oob”, “plain”. If “resample” is given, the out-of-resampling-fold predictions are used when resampling according to the resampling parameter. If “oob” is used, the Learner must have the “oobpreds” property; the out-of-bag predictions are then used. If train.residuals is “plain”, the simple regression residuals are used. “plain” may offer slightly worse performance than the alternatives, but few mlr Learners support “oobpreds”, and “resample” can come at a considerable run time penalty. Default is “plain”.
crr.resampling	[ResampleDesc ResampleInstance] What resampling to use when train.residuals is “resample”; otherwise has no effect. The \$predict slot of the resample description will be ignored and set to test. If a data point is predicted by multiple resampling folds, the average residual is used. If a data point is not predicted by any resampling fold, the “plain” residual is used for that one. Default is cv5.
id	[character(1)] id to use as prefix for the CPO’s hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.

<code>export</code>	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values “export.all” (export all parameters), “export.default” (export all parameters that are exported by default), “export.set” (export all parameters that were set during construction), “export.default.set” (export the intersection of the “default” and “set” parameters), “export.unset” (export all parameters that were <i>not</i> set during construction) or “export.default.unset” (export the intersection of the “default” and “unset” parameters). Default is “export.default”.
<code>affect.type</code>	[character NULL] Type of columns to affect. A subset of “numeric”, “factor”, “ordered”, “other”, or NULL to not match by column type. Default is NULL.
<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is <code>integer(0)</code> .
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is <code>character(0)</code> .
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

Value

[CPO](#) .

CPOTrained State

The `CPORegrResiduals` state’s `$control` slot is the [WrappedModel](#) created when training the learner on the given data.

The `CPOInverter` state’s `$control` slot is a `data.frame` of the “response” and (if `predict.se` is TRUE) “se” columns of the prediction done by the model on the data.

General CPO info

This function creates a CPO object, which can be applied to `Tasks`, `data.frames`, `link{Learner}`s and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function `setHyperPars`. The other hyper-parameter manipulating functions, `getHyperPars` and `getParamSet` similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

`cpoResponseFromSE`

Use the “se” predict.type for “response” Prediction

Description

This is a `CPOConstructor` to be used to create a `CPO`. It is called like any R function and returns the created `CPO`.

Some `Learners` may give better “response” prediction if their “se” `predict.type` is used, especially when a `cpoApplyFunRegrTarget` is used on it. This `CPO` performs no transformation of the data, but instructs the underlying `Learner` to do “se” prediction when “response” prediction is requested (the default) and drops the `se` column.

Usage

```

cpoResponseFromSE(
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)

```

Arguments

<code>id</code>	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
<code>export</code>	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
<code>affect.type</code>	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.

```

affect.pattern.perl
    [logical(1)]
    Use Perl-style regular expressions for affect.pattern; see grep. Default is
    FALSE.
affect.pattern.fixed
    [logical(1)]
    Use fixed matching instead of regular expressions for affect.pattern; see
    grep. Default is FALSE.

```

cpoSample

*Sample Data from a Task***Description**

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Takes samples from a task to decrease (or possibly increase) its size. This can be used to reduce training time, or to implement bootstrapping.

Usage

```
cpoSample(
  rate = NULL,
  size = NULL,
  replace = FALSE,
  id,
  export = "export.default"
)
```

Arguments

rate	[numeric(1) NULL] How many samples to take, relative to the task size. Default is NULL: Not using relative sampling rate. Exactly one of this or <code>size</code> must be non-NULL.
size	[integer(1) NULL] How many samples to take. Default is NULL: Not using absolute size. Exactly one of this or <code>size</code> must be non-NULL.
replace	[logical(1)] Whether to sample with replacement. Default is FALSE.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".

cpoScale

Construct a CPO for Scaling / Centering

Description

This is a `CPOConstructor` to be used to create a `CPO`. It is called like any R function and returns the created `CPO`.

Usage

```
cpoScale(
  center = TRUE,
  scale = TRUE,
```

```

    id,
    export = "export.default",
    affect.type = NULL,
    affect.index = integer(0),
    affect.names = character(0),
    affect.pattern = NULL,
    affect.invert = FALSE,
    affect.pattern.ignore.case = FALSE,
    affect.pattern.perl = FALSE,
    affect.pattern.fixed = FALSE
  )

```

Arguments

center	[logical(1)] Whether to center the data. Default is TRUE.
scale	[logical(1)] Whether to scale the data. Default is TRUE.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
affect.invert	[logical(1)] Whether to affect all features <i>not</i> matched by other affect.* parameters.

`affect.pattern.ignore.case`
 [logical(1)]
 Ignore case when matching features with `affect.pattern`; see [grep](#). Default is FALSE.

`affect.pattern.perl`
 [logical(1)]
 Use Perl-style regular expressions for `affect.pattern`; see [grep](#). Default is FALSE.

`affect.pattern.fixed`
 [logical(1)]
 Use fixed matching instead of regular expressions for `affect.pattern`; see [grep](#). Default is FALSE.

Value

[CPO](#) .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

cpoScaleMaxAbs *Max Abs Scaling CPO*

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Scale the numeric data columns so their maximum absolute value is `maxabs`, if possible. `NA`, `Inf` are ignored, and features that are constant 0 are not scaled.

Usage

```
cpoScaleMaxAbs(
  maxabs = 1,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

<code>maxabs</code>	[numeric(1)] The maximum absolute value for each column after transformation. Default is 1.
<code>id</code>	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOs with hyperparameters with clashing names.
<code>export</code>	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".

<code>affect.type</code>	[character NULL] Type of columns to affect. A subset of “numeric”, “factor”, “ordered”, “other”, or NULL to not match by column type. Default is NULL.
<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

cpoScaleRange

Range Scaling CPO

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Linearly transform data columns so they are between lower and upper. If lower is greater than upper, this will reverse the ordering of input data. NA, Inf are ignored.

Usage

```
cpoScaleRange(
  lower = 0,
  upper = 1,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

lower	[numeric(1)] Target value of smallest item of input data. Default is 0.
upper	[numeric(1)] Target value of greatest item of input data. Default is 1.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".
affect.type	[character NULL] Type of columns to affect. A subset of "numeric", "factor", "ordered", "other", or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
affect.invert	[logical(1)] Whether to affect all features <i>not</i> matched by other affect.* parameters.
affect.pattern.ignore.case	[logical(1)] Ignore case when matching features with affect.pattern; see grep . Default is FALSE.
affect.pattern.perl	[logical(1)] Use Perl-style regular expressions for affect.pattern; see grep . Default is FALSE.
affect.pattern.fixed	[logical(1)] Use fixed matching instead of regular expressions for affect.pattern; see grep . Default is FALSE.

 cpoSelect

Drop All Columns Except Certain Selected Ones from Data

Description

This is a `CPOConstructor` to be used to create a `CPO`. It is called like any R function and returns the created `CPO`.

Select columns by type or name. The parameters “type” and “pattern” are additive; if both are given, all column that match either will be returned.

cpoSelectFreeProperties behaves just as cpoSelect, with the additional function that it is treated like a **CPO** that removes all data properties from the data. This disables the internal property check and can be useful when trying to compose **CPOs** that do not have compatible properties.

Usage

```
cpoSelect(  
  type = character(0),  
  index = integer(0),  
  names = character(0),  
  pattern = NULL,  
  pattern.ignore.case = FALSE,  
  pattern.perl = FALSE,  
  pattern.fixed = FALSE,  
  invert = FALSE,  
  id,  
  export = "export.default",  
  affect.type = NULL,  
  affect.index = integer(0),  
  affect.names = character(0),  
  affect.pattern = NULL,  
  affect.invert = FALSE,  
  affect.pattern.ignore.case = FALSE,  
  affect.pattern.perl = FALSE,  
  affect.pattern.fixed = FALSE  
)
```

```
cpoSelectFreeProperties(  
  type = character(0),  
  index = integer(0),  
  names = character(0),  
  pattern = NULL,  
  pattern.ignore.case = FALSE,  
  pattern.perl = FALSE,  
  pattern.fixed = FALSE,  
  invert = FALSE,  
  id,  
  export = "export.default",  
  affect.type = NULL,  
  affect.index = integer(0),  
  affect.names = character(0),  
  affect.pattern = NULL,  
  affect.invert = FALSE,  
  affect.pattern.ignore.case = FALSE,  
  affect.pattern.perl = FALSE,  
  affect.pattern.fixed = FALSE  
)
```

Arguments

type	[character] One or more out of “numeric”, “ordered”, “factor”, “other”. The type of columns to keep. Default is character(0).
index	[integer] Indices of columns to keep. Note that the index counts columns without the target column(s). This and the next parameter make it possible to re-order columns. While all columns which match either “type”, “pattern” or “index” remain in the resulting data, the ones selected by “index” are put at the front in the order specified. Default is integer(0).
names	[character] Names of columns to keep. Matching columns will be kept in order of their names occurring, but after the columns indicated in “index”.
pattern	[character(1)] A pattern to match against the column names. Same as in <code>grep</code> . Default is NULL for no matching.
pattern.ignore.case	[logical(1)] Influences behaviour of “pattern”: Whether to perform case insensitive matching. Same as in <code>grep</code> . Default is FALSE.
pattern.perl	[logical(1)] Influences behaviour of “pattern”: Should Perl-compatible regexps be used? Same as in <code>grep</code> . Default is FALSE.
pattern.fixed	[logical(1)] Influences behaviour of “pattern”: Whether to use match pattern as is. Same as in <code>grep</code> . Default is FALSE.
invert	[logical(1)] Invert column selection: Drop the named columns and return the rest, instead of keeping the selected columns only. Default is FALSE.
id	[character(1)] id to use as prefix for the CPO’s hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOs with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values “export.all” (export all parameters), “export.default” (export all parameters that are exported by default), “export.set” (export all parameters that were set during construction), “export.default.set” (export the intersection of the “default” and “set” parameters), “export.unset” (export all parameters that were <i>not</i> set during construction) or “export.default.unset” (export the intersection of the “default” and “unset” parameters). Default is “export.default”.
affect.type	[character NULL] Type of columns to affect. A subset of “numeric”, “factor”, “ordered”, “other”, or NULL to not match by column type. Default is NULL.

<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is <code>integer(0)</code> .
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is <code>character(0)</code> .
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

cpoSmote

*Perform SMOTE Oversampling for Binary Classification***Description**

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Uses `mlr`'s [smote](#) function to perform “Synthetic Minority Oversampling TEchnique” sample generation to handle class imbalance in binary tasks.

See the [smote](#) documentation for details.

Usage

```
cpoSmote(
  rate = NULL,
  nn = 5,
  standardize = TRUE,
  alt.logic = FALSE,
  id,
  export = "export.default"
)
```

Arguments

<code>rate</code>	<code>[numeric(1) NULL]</code> Upsampling factor, between 1 and Inf. Default is NULL, which sets this to the ratio <code><majority prevalence> / <minority prevalence></code>
<code>nn</code>	<code>[integer(1)]</code> Number of nearest neighbours to consider. Defaults to 5.

standardize	[integer(1)] Standardize feature values. Default is TRUE.
alt.logic	[integer(1)] Use alternative logic for minority selection. Default is FALSE.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".

Value

cpoSpatialSign

Scale Rows to Unit Length

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Normalizes the data row-wise. This is a natural generalization of the "sign" function to higher dimensions.

Usage

```

cpoSpatialSign(
  length = 1,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)

```

Arguments

length	[numeric(1)] Length to scale rows to. Default is 1.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default"

	(export all parameters that are exported by default), “export.set” (export all parameters that were set during construction), “export.default.set” (export the intersection of the “default” and “set” parameters), “export.unset” (export all parameters that were <i>not</i> set during construction) or “export.default.unset” (export the intersection of the “default” and “unset” parameters). Default is “export.default”.
affect.type	[character NULL] Type of columns to affect. A subset of “numeric”, “factor”, “ordered”, “other”, or NULL to not match by column type. Default is NULL.
affect.index	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
affect.names	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
affect.pattern	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
affect.invert	[logical(1)] Whether to affect all features <i>not</i> matched by other affect.* parameters.
affect.pattern.ignore.case	[logical(1)] Ignore case when matching features with affect.pattern; see grep . Default is FALSE.
affect.pattern.perl	[logical(1)] Use Perl-style regular expressions for affect.pattern; see grep . Default is FALSE.
affect.pattern.fixed	[logical(1)] Use fixed matching instead of regular expressions for affect.pattern; see grep . Default is FALSE.

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

CPOTrained

Get the Retransformation or Inversion Function from a Resulting Object

Description

When applying a CPO to a `data.frame` or `Task`, the data is not only changed, additionally a retransformation and an inversion object is created that can be applied to other data of the same kind. This is useful if new data (for prediction or validation) is to be handled in the same machine learning procedure.

For example, when performing PCA on training data using `cpoPca`, the rotation matrix is saved and can be used on new (prediction) data. As another example, consider a log-transformation of the target column in a regression problem. When predictions are made with new data, it may be useful to invert the transformation on the predicted values by exponentiating them.

The information created when a CPO is applied is saved in a `CPORetrafo` object, and a `CPOInverter` object, which are both saved as *attributes*. The `retrafo` and `inverter` function retrieve these objects. It is furthermore possible to set these attributes using the `retrafo<-` and `inverter<-` functions, using constructs like `retrafo(data) <- retr.obj`. The `retrafo` or `inverter` attributes can be reset individually by setting them to `NULL`: `retrafo(data) <- NULL`, or by using the `clearRI` function.

When chaining `%>%` on a data object, the `retrafo` and `inverter` associated with the result is also chained automatically. Beware, however, that this just accesses the `retrafo` attribute internally. Therefore, if you plan to do apply multiple transformations with other operations in between, make sure to reset the `retrafo` function by setting it to `NULL`, or using the `clearRI` function. See examples.

Usage

```

retrafo(data)

inverter(data)

retrafo(data) <- value

inverter(data) <- value

```

Arguments

data	[data.frame Task WrappedModel] The result of a CPO applied to a data set.
value	[CPOTrained NULL] The retrafo or inverter to set. This must either be a CPORetrafo for <code>retrafo<-</code> or a CPOInverter for <code>inverter<-</code> , or NULL to reset the <code>retrafo</code> or <code>inverter</code> attributes.

Value

[CPOTrained](#) . The retransformation function that can be applied to new data. This is a [CPORetrafo](#) object for `retrafo` or a [CPOInverter](#) object for `inverter`.

CPORetrafo and CPOInverter

[CPORetrafo](#) and [CPOInverter](#) objects are members of the [CPOTrained](#) class, which can be handled similarly to [CPO](#) objects: Their hyperparameters can be inspected using [getParamSet](#) and `link[mlr]{getHyperPars}`, [print.CPOTrained](#) is used for (possibly verbose) printing. To apply the `retrafo` or `inverter` transformation represented by the object to data, use the [applyCPO](#) or `%>>%` function.

[CPOTrained](#) objects can be chained using `%>>%` or [pipeCPO](#), and broken into primitives using [as.list.CPOTrained](#). However, since the [CPOTrained](#) objects represent transformations that relate closely to the data used to train it (and therefore to the position within a [CPO](#) pipeline), it is only advisable to chain or break apart [CPOTrained](#) pipes for inspection, or if you really know what you are doing.

(Primitive) [CPORetrafo](#) objects can be inspected using [getCPOTrainedState](#), and it is possible to create new [CPORetrafo](#) objects from (possibly modified) `retrafo` state using [makeCPOTrainedFromState](#).

Difference between CPORetrafo and CPOInverter

The fundamental difference between [CPORetrafo](#) and [CPOInverter](#) is that a [CPORetrafo](#) is created only when a [CPO](#) is applied to a data set, and is used to perform the same transformation on new (prediction) data. The [CPOInverter](#) is created whenever a [CPO](#) or [CPORetrafo](#) is applied to data (whether training or prediction data). It is in fact used to invert the transformation done to the target column of a [Task](#). Since this operation may depend on the new prediction data, and not only on the training data fed to the [CPO](#) when the [CPORetrafo](#) was created, the [CPOInverter](#) object is more closely bound to the particular data set used to create it.

In some cases a target transformation is independent of the data used to create it (e.g. log-transform of a regression target column); in that case the CPORetrafo can be used with `invert`. This is the concept of `CPOTrainedCapability`, which can be queried using `getCPOTrainedCapability`.

Using CPORetrafo

CPORetrafo objects can be applied to new data sets using the `%>>%` operator, the `applyCPO` generic, or the `predict` generic, all of which perform the same action.

Using CPOInverter

To use a CPOInverter, use the `invert` function.

Examples

```
trairdat = subsetTask(pid.task, 1:400)
preddat = subsetTask(pid.task, 401:768)

trained = trairdat %>>% cpoPca()
reFun = retrrafo(trained)
predicted = preddat %>>% reFun
head(getTaskData(predicted))

# chaining works
trained = trairdat %>>% cpoPca() %>>% cpoScale()
reFun = retrrafo(trained)
predicted = preddat %>>% reFun
head(getTaskData(predicted))

# reset the retrrafo when doing other steps!

trained.tmp = trairdat %>>% cpoPca()
reFun1 = retrrafo(trained.tmp)

imp = impute(trained.tmp)
```

```

trained.tmp = imp$task # nonsensical example
retrafo(trained.tmp) = NULL # NECESSARY HERE

trained = trained.tmp %>>% cpoScale()

reFun2 = retrafo(trained)
predicted = getTaskData(reimpute(preddat %>>% reFun1, imp$desc),
  target.extra = TRUE)$data %>>% reFun2

```

cpoTransformParams *Transform CPO Hyperparameters*

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Transforms hyperparameters, or establishes dependencies between them. The [CPO](#) given to `cpoTransformParams` gets wrapped inside a new [CPO](#) with different hyperparameters. The parameters for which a transformation is given are not exported (unless also given in additional `.parameters`).

Usage

```

cpoTransformParams(
  cpo = NULLCPO,
  transformations = list(),
  additional.parameters = makeParamSet(),
  par.vals = list()
)

```

Arguments

cpo	<p>[CPO]</p> <p>The CPO to use. Currently this may only have a single OperatingType. Default is <code>NULLCPO</code>.</p>
transformations	<p>[named list of language]</p> <p>This list contains expressions or quotes that are evaluated in the context of the <i>externally given</i> hyperparameters and then give the values of the internal hyperparameters. The name of each list element determines to what hyperparameter of <code>cpo</code> the result of the expression is written.</p> <p>Expressions can not depend on the results of other expressions.</p> <p>Hyperparameters of <code>cpo</code> named in this list are not exported by the <code>TransformParams CPO</code>. It is, however, possible to create synonymous parameters in <code>additional.parameters</code>. Default is <code>list()</code>.</p>

<code>additional.parameters</code>	<code>[ParamSet]</code> Additional parameters to create, on which expressions in transformations may depend. They may contain the same names as transformations, but may not have names of hyperparameters of <code>cpo</code> that are <i>not</i> in transformations.
<code>par.vals</code>	<code>[list]</code> Optional default values of parameters in <code>additional.parameters</code> . These override the <code>ParamSet</code> 's default values. Default is <code>list()</code> . These must only concern parameters in <code>additional.parameters</code> , not the ones in <code>cpo</code> .

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to `Tasks`, `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function `setHyperPars`. The other hyper-parameter manipulating functions, `getHyperPars` and `getParamSet` similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

Other special CPOs: `cpoCbind()`, `cpoWrap()`, `makeCPOCase()`, `makeCPOMultiplex()`

 cpoWrap

CPO Wrapper

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

Applies the [CPO](#) that is given to the [CPO](#) hyperparameter.

cpoWrap only wraps Feature Operation CPOs, cpoWrapRetrafoless only wraps Retrafoless CPOs.

Target Operation CPOs currently cannot be wrapped, sorry.

Usage

```
cpoWrap(
  cpo,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)

cpoWrapRetrafoless(cpo, id, export = "export.default")
```

Arguments

cpo	[CPO] The CPO to wrap.
id	[character(1)] id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOs with hyperparameters with clashing names.
export	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values "export.all" (export all parameters), "export.default" (export all parameters that are exported by default), "export.set" (export all parameters that were set during construction), "export.default.set" (export the intersection of the "default" and "set" parameters), "export.unset" (export all parameters that were <i>not</i> set during construction) or "export.default.unset" (export the intersection of the "default" and "unset" parameters). Default is "export.default".

<code>affect.type</code>	[character NULL] Type of columns to affect. A subset of “numeric”, “factor”, “ordered”, “other”, or NULL to not match by column type. Default is NULL.
<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

getCPOAffect *Get the Selection Arguments for Affected CPOs*

Description

Get the affect.* arguments from when the CPO was constructed. These are in one-to-one correspondence to the affect.* parameters given to the CPOConstructor, see the parameter documentation there.

Usage

```
getCPOAffect(cpo, drop.defaults = TRUE)
```

Arguments

cpo	[CPO] The cpo.
drop.defaults	[logical(1)] Whether to only return the arguments that deviate from the default. Default is TRUE.

Value

list . A named list of the affect.* arguments given to the CPOConstructor. The names are stripped of the “affect.”-prefix.

See Also

Other getters and setters: CPO, getCPOClass(), getCPOConstructor(), getCPOId(), getCPOName(), getCPOOperatingType(), getCPOPredictType(), getCPOProperties(), getCPOTrainedCPO(), getCPOTrainedCapability(), setCPOId()

getCPOClass *Get the CPO Class*

Description

Gets the relevant CPO class that distinguishes between steps in a CPO’s lifecycle.

There is a fundamental distinction between CPO objects and CPOTrained objects, the latter of which can provide either retrafo or inverter functionality, or both. CPOTrained are subclassed into CPOInverter (only inverter functionality), or CPORetrafo (retrafo, possibly also inverter). To get more information about a CPORetrafo object’s capabilities, use getCPOTrainedCapability.

Usage

```
getCPOClass(cpo)
```

Arguments

cpo [CPOConstructor | CPO | CPOTrained]
The CPO.

Value

character(1) . “CPOConstructor” if the given object is a [CPOConstructor](#), “CPO” for a [CPO](#), “CPOInverter” for a [CPOInverter](#) only, “CPORetrafo” for a [CPORetrafo](#) object (which may have inverter capabilities, see [link{getCPOTrainedCapability}](#)), “NULLCPO” for a [NULLCPO](#).

See Also

Other CPO classifications: [CPO](#), [getCPOOperatingType\(\)](#), [getCPOTrainedCapability\(\)](#)

Other CPO lifecycle related: [CPOConstructor](#), [CPOLearner](#), [CPOTrained](#), [CPO](#), [NULLCPO](#), [%>>%\(\)](#), [attachCPO\(\)](#), [composeCPO\(\)](#), [getCPOConstructor\(\)](#), [getCPOTrainedCPO\(\)](#), [identicalCPO\(\)](#), [makeCPO\(\)](#)

getCPOConstructor *Get the CPOConstructor Used to Create a CPO Object*

Description

Get the [CPOConstructor](#) used to create a [CPO](#) or [CPOTrained](#) object. Only primitive [CPO](#) or [CPOTrained](#) objects have an originating [CPOConstructor](#).

Usage

```
getCPOConstructor(cpo)
```

Arguments

cpo [CPO | CPOTrained]
The CPO, Retrafo, or Inverter to get the original [CPOConstructor](#) from.

Value

[CPOConstructor](#) . The original [CPOConstructor](#).

See Also

Other getters and setters: [CPO](#), [getCPOAffect\(\)](#), [getCPOClass\(\)](#), [getCPOId\(\)](#), [getCPOName\(\)](#), [getCPOOperatingType\(\)](#), [getCPOPredictType\(\)](#), [getCPOProperties\(\)](#), [getCPOTrainedCPO\(\)](#), [getCPOTrainedCapability\(\)](#), [setCPOId\(\)](#)

Other CPOConstructor related: [CPOConstructor](#), [getCPOClass\(\)](#), [getCPOName\(\)](#), [identicalCPO\(\)](#), [makeCPO\(\)](#), [print.CPOConstructor\(\)](#)

getCPOId

Get the ID of a CPO Object

Description

Gets the *id* of a [CPO](#). The id can be set during construction by a [CPOConstructor](#) using the `id` parameter, or with [setCPOId](#).

The exported hyperparameters of a CPO all have the id as prefix. This makes it possible to compose CPOs that have clashing parameter names.

Usage

```
getCPOId(cpo)
```

Arguments

cpo	[CPO] The cpo.
-----	-------------------

Value

character(1) the CPO's id.

See Also

Other getters and setters: [CPO](#), [getCPOAffect\(\)](#), [getCPOClass\(\)](#), [getCPOConstructor\(\)](#), [getCPOName\(\)](#), [getCPOOperatingType\(\)](#), [getCPOPredictType\(\)](#), [getCPOProperties\(\)](#), [getCPOTrainedCPO\(\)](#), [getCPOTrainedCapability\(\)](#), [setCPOId\(\)](#)

Other CPO ID related: [setCPOId\(\)](#)

getCPOName

Get the CPO Object's Name

Description

Return the name associated with a CPO operation. This name is set when creating a [CPOConstructor](#), e.g. using [makeCPO](#), by the “.cpo.name” parameter. It is also the default id, as retrieved by [getCPOId](#), of a CPO.

Usage

```
getCPOName(cpo)

## S3 method for class 'CPOTrained'
getCPOName(cpo)

## S3 method for class 'CPOConstructor'
getCPOName(cpo)
```

Arguments

cpo [\[CPO\]](#)
The cpo.

Value

character(1) the CPO's name.

getCPOOperatingType *Determine the Operating Type of the CPO*

Description

Gives the *operating type* of a CPO or Retrafo, i.e. the part of a given data set it operates on. This can be “target” for a CPO / Retrafo / Inverter that manipulates target columns, “feature” for a CPO / Retrafo that manipulates non-target columns, or “retrafoless” for a CPO that only handles training data (and hence can manipulate both feature and target columns, but produces no retrafo).

For a composite CPO / Retrafo of different operating types, all types are returned. NULLCPO has no operating type.

Usage

```
getCPOOperatingType(cpo)
```

Arguments

cpo	[CPO CPOTrained] The CPO, Retrafo, or Inverter to inspect.
-----	---

Value

character(1) . Zero or more of “target”, “feature”, “retrafoless”.

Operating types

There are three types of CPO that differ in their effects on the data: “*Feature Operation*”, “*Target Operation*”, and “*Retrafoless*”.

Feature Operation CPOs (**FOCPO**) only change the feature columns of a data set, and don’t change the target column(s). They therefore cannot change the type of a **Task**, and will never change the number of rows of a data set. They are the easiest CPO to handle, as they do not require inversion of predictions made with processed data. Examples of Feature Operation CPOs is the scaling of individual features to have unit variance (**cpoScale**), or the projection on principal components (**cpoPca**).

Target Operation CPOs (**TOCPO**) only change the target column(s) of a data set, not the feature columns. They can thus also change the type of a **Task**, and the **PredictTypes** admitted by a **Learner**. They are thus a powerful instrument, but they are harder to handle, since predictions made with data sets processed with this kind of CPO need to be *inverted* using the **invert** function and possibly an **CPOInverter** object (see documentation there). (Note that attaching a Target Operation CPO to a **Learner** will hide this complexity from the user and is the recommended way of handling it.) Examples of Target Operation CPOs are the log-transformation of the target column of a regression task, the conversion of a binary classification task into a 0-1-regression task, or the substitution of the target values into the residuals after a **Learner** was applied to the task. Note that the last of these examples distinguishes itself by the fact that the inversion operation is dependent on the *prediction* data used. While for the first two examples, the **CPORetrafo** object can be used for

inversionk, the last one requires the `CPOInverter` object. See `CPOTrainedCapability` for more on this.

Retrafoless CPOs (**ROCPO**) can change the feature *and* target columns of a task, but this comes at the cost of not allowing retractions. When getting the `CPORetrafo` object using `retrafo`, one will always get an identity transformation. While other CPOs can be understood as *transforming* the space of features or target values, respectively, the Retrafoless CPO can only *add* or *subtract* points in the given space. Examples of this operation are subsampling and supersampling.

getCPOPredictType *Get the CPO predict.type*

Description

Get the possible predict.types a `CPO` is able to handle.

The concept of a `predict.type` originates from `predict.WrappedModel`, which allows the estimation of different aspects of a prediction. This is, currently:

“**response**” A best estimate of the actual target value

“**prob**” An estimate of probabilities of different target values

“**se**” An estimate of the target value, together with an estimate of the standard error of this first estimation

A Target Operation CPO is able to change the type of a `Task`, but it can also enhance the type of predictions that a `Learner` can make for it. Thus a CPO that converts a binary classification into a regression task can use a regression learner to not only predict the “response” class, but also the estimated probability (“prob”) distribution over the two classes. For this, the CPO declares

1. what `predict.types` a `Learner`, when attached to it, can provide, and
2. what `predict.type` the `Learner`, in each case, must be capable of.

This information is provided in the form of a named character, where the names are the provided predict type capabilities, and the values are the predict type that the underlying [Learner](#) must provide for this.

The CPO converting classification to regression mentioned above would thus have the `predict.type` of:

```
c(response = "response", prob = "response")
```

Another example would be a CPO that converts a multiclass classification problem into an ordinary classification problem, but uses the “prob” prediction of the underlying learner to make both the “response” and “prob” predictions. It would have the `predict.type` of:

```
c(response = "prob", prob = "prob")
```

If this second CPO is attached to a [Learner](#) that does not have the “prob” property (see [LearnerProperties](#)), an error is given.

CPOs that are not Target Operating always have the `predict.type` of:

```
c(response = "response", prob = "prob", se = "se")
```

Usage

```
getCPOPredictType(cpo)
```

```
## S3 method for class 'CPOTrained'
getCPOPredictType(cpo)
```

Arguments

```
cpo          [CPO]
             The cpo.
```

Value

character . A named character that maps potential predict types that a CPO may provide to the required predict type of an underlying learner.

 getCPOProperties

Get the Properties of the Given CPO Object

Description

The properties of a CPO object determine the kind of data the CPO will be able to handle, and how it transforms data. Properties describe what kind of data a CPO can work with.

By default, this function returns a list of three values: `$handling`, `$adding`, and `$needed`.

The `$handling` determines what data the CPO handles. If a CPO is applied to a data set (using `%>%` or `applyCPO`, or indirectly when a `CPOLearner` is trained) that has a property not listed in `$handling`, an error will be given.

`$adding` can be one or many of the same values as `$handling`. These properties get added to a `Learner` or CPO coming after / behind this CPO. When a CPO imputes missing values, for example, this is “missings”. This is always a subset of `$handling`.

`$properties.needed` can be one or many of the same values as `$handling`. These properties are required from a `Learner` (or CPO) coming after / behind this CPO. E.g., when a CPO converts factors to numerics, this is “numerics” (and `$adding` would be “factors” in this case). `$adding` and `$needed` never have any value in common.

There are two more properties mostly for internal usage: `$adding.min` and `$needed.max`. These are for internal checking of `trafo` / `retrafo` function return values: If some hyperparameter settings lead to a CPO returning values not conforming to properties (e.g. not removing all ‘missings’, or creating ‘missings’ where there were none before), while in other cases the CPO *does* conform, it is desirable to treat the CPO like it behaves in the best case (and rely on the user to make good hyperparameter choices). The properties discussed so far thus represent the CPO on its ‘best’ behaviour. Internally, each CPO also has a list of properties that it minimally ‘adds’ to its successors or maximally ‘needs’ from it in the worst case. These are `$adding.min` and `$needed.max`. `$adding.min` is always a subset of `$adding`, `$needed.max` is always a superset of `needed`. Their compliance is checked by the CPO framework, so a CPO that doesn’t conform to these crashes.

Usage

```
getCPOProperties(cpo, only.data = FALSE, get.internal = FALSE)
```

```
## S3 method for class 'CPOTrained'
```

```
getCPOProperties(cpo, only.data = FALSE, get.internal = FALSE)
```

Arguments

<code>cpo</code>	[CPO] The cpo.
<code>only.data</code>	[logical(1)] Only get the CPO <i>data properties</i> (not target or task type properties). Default is FALSE.
<code>get.internal</code>	[logical(1)] Also retrieve <code>\$adding.min</code> and <code>\$needed.max</code> . Default is FALSE.

Value

list . A list with slots \$handling, \$adding, and \$needed; also \$adding.min and \$needed.max if get.internal is TRUE.

Possible properties

data properties “numerics”, “factors”, “ordered”, “missings”: Whether any data column contains the type in question, or has missings. When only.data is TRUE, only these are returned.

task type properties “cluster” “classif” “multilabel” “regr” “surv”: The type of the task. `data.frame` data objects have the implicit property “cluster”.

target properties “oneclass” “twoclass” “multiclass”: Whether the target column of a `classif` task has one, two, or more classes.

getCPOTrainedCapability

Get the CPOTrained's Capabilities

Description

While `CPOInverter` is only used for inversion, both `CPORetrafo` and `CPOInverter` objects could be used for inversion using `invert` in principle. However, some `CPORetrafo` objects forbid inversion (and one must use the `CPOInverter` object instead), some `CPORetrafo` objects are NO-OPS when called with `invert`, some can be used both for transformation and inversion.

The `CPOTrainedCapability` is a named integer(2) with two slots: “retrafo” and “invert”. Both can be 1 (`CPOTrained` does something when used in retrafo / inversion), 0 (`CPOTrained` is a NO-OP when used in retrafo / inversion) or -1 (`CPOTrained` cannot be used in retrafo / inversion).

Usage

```
getCPOTrainedCapability(cpo)
```

Arguments

cpo [CPOTrained]
 The CPOTrained object to query.

Value

named integer(2) . The first component is named “retrafo” and specifies whether the object can perform retrafo operations; the second component is named “invert” and specifies whether it can perform invert operations. 0 indicates no effect for the operation, 1 indicates an operation is performed, -1 indicates the object cannot be used for the purpose.

Inverter capability

The invert capability of a CPOTrained depends on the CPO which was used to create it. Whenever a CPO is applied to some data, the result has the link{retrafo} and inverter attributes set that can be retrieved using the respectively named functions to get the CPORetrafo and CPOInverter object.

Every CPO can be a “Feature Operation” CPO, a “Target Operation” CPO, or a “Retrafoless” CPO, or a composition of these (see OperatingType).

If a (possibly compound) CPO contains only Feature Operation CPOs and Retrafoless CPOs, then it does not perform any operation on the target column of a data set; hence there is no inversion to be performed, the resulting CPORetrafo is a NO-OP when used with invert. The inverter attribute created is in fact a NULLCPO, while the retrafo attribute contains a CPORetrafo with capabilities c(retrafo = 1, invert = 0).

If a (possibly compound) CPO also contains Target Operation CPOs, but they are independent of the prediction data features—e.g. a CPO that takes the logarithm of the target column in a regression task—then the CPORetrafo object has enough information to perform inversion and hence can also meaningfully be used with invert. In this case the capability of the CPORetrafo will be c(retrafo = 1, invert = 1). The CPOInverter object retrieved using the inverter function can be used for the same task, but the benefit of the CPORetrafo object is that it can be used for all prediction data applied to it, while the CPOInverter object needs to be retrieved for each prediction data set anew. The CPOInverter object furthermore cannot be used for retrafo and hence has, like all CPOInverter, capabilities c(retrafo = -1, invert = 1).

If a (possibly compound) CPO contains Target Operation CPOs that are not prediction data independent then the resulting CPORetrafo has capability c(retrafo = 1, invert = -1), since the inversion requires information about the particular data set that was transformed.

A CPOInverter object always has capabilities c(retrafo = -1, invert = 1), since it can always be used for invert and never used in the place of a CPORetrafo.

The only object with capabilities c(retrafo = 0, invert = 0) is NULLCPO. Other objects that don’t have at least one capability equal to 1 cannot be created.

getCPOTrainedCPO	<i>Get CPO Used to Train a Retrafo / Inverter</i>
------------------	---

Description

Get the [CPO](#) used to create a [CPOTrained](#) object. The retrieved [CPO](#) will usually have all its hyperparameters and `affect.*` settings set to the values used to create the particular [CPOTrained](#) object. The only case where this is *not true* is if `cpo` is a [CPOTrained](#) that was created using [makeCPOTrainedFromState](#).

Usage

```
getCPOTrainedCPO(cpo)
```

Arguments

<code>cpo</code>	[CPOTrained] The Retrafo or Inverter to get the original CPO from.
------------------	---

Value

[CPO](#) . The original [CPO](#).

See Also

getCPOTrainedState *Get the Internal State of a CPORetrafo Object*

Description

A [CPOTrained](#) always has access to some kind of state that represents information gotten from the training data, as well as the parameters it was called with.

Only primitive [CPOTrained](#) objects can be inspected like this. If the supplied [CPOTrained](#) is not primitive, split it into its constituents using [as.list.CPOTrained](#).

The structure of the internal state depends on the [CPO](#) backend used. For Functional CPO, the state is the environment of the retrafo function, turned into a list. For Object based CPO, the state is a list containing the parameters, as well as the control object generated by the trafo function.

The object can be slightly modified and used to create a new [CPOTrained](#) object using [makeCPOTrainedFromState](#).

Usage

```
getCPOTrainedState(trained.object)
```

Arguments

```
trained.object [CPOTrained]
               The object to get the state of.
```

Value

list . A named list, containing the complete internal state of the [CPOTrained](#).

See Also

Other state functions: [makeCPOTrainedFromState\(\)](#)

Other retrafo related: [CPOTrained](#), [NULLCPO](#), [%>>%\(\)](#), [applyCPO\(\)](#), [as.list.CPO](#), [clearRI\(\)](#), [getCPOClass\(\)](#), [getCPOName\(\)](#), [getCPOOperatingType\(\)](#), [getCPOPredictType\(\)](#), [getCPOProperties\(\)](#), [getCPOTrainedCPO\(\)](#), [getCPOTrainedCapability\(\)](#), [is.retrafo\(\)](#), [makeCPOTrainedFromState\(\)](#), [pipeCPO\(\)](#), [print.CPOConstructor\(\)](#)

Other inverter related: [CPOTrained](#), [NULLCPO](#), [%>>%\(\)](#), [applyCPO\(\)](#), [as.list.CPO](#), [clearRI\(\)](#), [getCPOClass\(\)](#), [getCPOName\(\)](#), [getCPOOperatingType\(\)](#), [getCPOPredictType\(\)](#), [getCPOProperties\(\)](#), [getCPOTrainedCPO\(\)](#), [getCPOTrainedCapability\(\)](#), [is.inverter\(\)](#), [makeCPOTrainedFromState\(\)](#), [pipeCPO\(\)](#), [print.CPOConstructor\(\)](#)

getLearnerBare *Get the Learner with the CPOs Removed*

Description

Get the bare [Learner](#) without the [CPOs](#) that were previously added.

It is still possible for the result to be a wrapped learner, e.g. a [TuningWrapper](#) wrapped learner. It is also possible that below the tuning wrapper, there are more [CPOs](#). These can and will not be removed.

This function is complementary to [getLearnerCPO](#).

Usage

```
getLearnerBare(learner)
```

Arguments

learner [[Learner](#)]
 The learner to strip.

Value

[Learner](#) . The learner without attached [CPOs](#).

See Also

Other [CPO](#)Learner related: [CPOLearner](#), [attachCPO\(\)](#), [getLearnerCPO\(\)](#)

getLearnerCPO *Get the CPO Associated with a Learner*

Description

Returns the (outermost) chain of [CPOs](#) that are part of a [Learner](#). This is useful to inspect the preprocessing done by a learner object.

If there are hidden [CPOs](#) (e.g. if a learner has [CPOs](#), but is then wrapped by a [TuneWrapper](#)), this function can not retrieve these [CPOs](#), but it will emit a warning if `warn.buried` is `TRUE`.

The retrieved [CPOs](#) will have the hyperparameter set according to the hyperparameter settings of the [Learner](#).

This function is complementary to [getLearnerBare](#).

Usage

```
getLearnerCPO(learner, warn.buried = TRUE)
```

Arguments

learner	[Learner] The learner to query
warn.buried	[logical(1)] Whether to warn about CPOs that could not be retrieved.

Value

[CPO](#) . The (possibly composite) CPO found attached to learner.

See Also

Other CPOlearner related: [CPOlearner](#), [attachCPO\(\)](#), [getLearnerBare\(\)](#)

 identicalCPO

Check Whether Two CPO are Fundamentally the Same

Description

Check whether two [CPO](#) perform the same operation. This compares the inner workings of a [CPO](#), but not the hyperparameter, hyperparameter-export, or `affect.*` settings of the [CPO](#).

Internally, this checks whether the [CPOConstructor](#) used to create the two [CPOs](#) is identical. When creating new [CPOConstructor](#)s with [makeCPO](#) and related functions, it may be necessary to overload this function, if the resulting [CPOs](#) should be differentiated in a different way.

This function is used in [cpoCbind](#) to check for equality of underlying [CPOs](#).

Usage

```
identicalCPO(cpo1, cpo2)
```

Arguments

cpo1	[CPO] The CPO to compare.
cpo2	[CPO] The CPO to compare.

Value

[logical\(1\)](#) . TRUE if the [CPOs](#) are fundamentally the same.

See Also

Other CPO lifecycle related: [CPOConstructor](#), [CPOLearner](#), [CPOTrained](#), [CPO](#), [NULLCPO](#), [%>>%\(\)](#), [attachCPO\(\)](#), [composeCPO\(\)](#), [getCPOClass\(\)](#), [getCPOConstructor\(\)](#), [getCPOTrainedCPO\(\)](#), [makeCPO\(\)](#)

Other CPOConstructor related: [CPOConstructor](#), [getCPOClass\(\)](#), [getCPOConstructor\(\)](#), [getCPOName\(\)](#), [makeCPO\(\)](#), [print.CPOConstructor\(\)](#)

invert

*Invert Target Preprocessing***Description**

Invert the transformation, done on the target column(s) of a data set, after prediction.

Use either a [CPORetrafo](#) object with invert capability (see [getCPOTrainedCapability](#), or a [CPOInverter](#) retrieved with [inverter](#) from a data object that was fed through a retrafa chain.

If a [CPORetrafo](#) object is used that contains no target-bound transformations (i.e. has “invert” capability 0), this is a no-op.

Usage

```
invert(inverter, prediction, predict.type = "response")
```

Arguments

inverter	[CPOInverter] The retrafa or inverter to apply
prediction	[Prediction matrix data.frame] The prediction to invert
predict.type	[character(1)] The equivalent to the predict.type property of a Learner object, control what kind of prediction to perform. One of “response”, “se”, “prob”. Default is “response”. Care must be taken that the prediction was generated with a prediction type that fits this, i.e. it must be of type <code>getCPOPredictType(inverter)[predict.type]</code> .

Value

[Prediction](#) | data.frame . A transformed [Prediction](#) if a prediction was given, or a data.frame. If the first object in the chain is a CPORetrafo object, the ‘truth’ column(s) of the prediction will be dropped.

is.inverter	<i>Check CPOInverter</i>
-------------	--------------------------

Description

Check whether the given object is a [CPOInverter](#) object.

Usage

```
is.inverter(x)
```

Arguments

x	[any] The object to check.
---	-------------------------------

Value

TRUE if x has class [CPOInverter](#), FALSE otherwise.

See Also

Other inverter related: [CPOTrained](#), [NULLCPO](#), [%>>%\(\)](#), [applyCPO\(\)](#), [as.list.CPO](#), [clearRI\(\)](#), [getCPOClass\(\)](#), [getCPOName\(\)](#), [getCPOOperatingType\(\)](#), [getCPOPredictType\(\)](#), [getCPOProperties\(\)](#), [getCPOTrainedCPO\(\)](#), [getCPOTrainedCapability\(\)](#), [getCPOTrainedState\(\)](#), [makeCPOTrainedFromState\(\)](#), [pipeCPO\(\)](#), [print.CPOConstructor\(\)](#)

is.nullcpo	<i>Check for NULLCPO</i>
------------	--------------------------

Description

Check whether the given object is a [NULLCPO](#).

Usage

```
is.nullcpo(x)
```

Arguments

x	[any] The object to check
---	------------------------------

Value

logical(1) . TRUE if x is a [NULLCPO](#), FALSE otherwise.

See Also

Other NULLCPO related: [NULLCPO](#), [nullToNullcpo\(\)](#), [nullcpoToNull\(\)](#)

is.retrafo	<i>Check CPORetrafo</i>
------------	-------------------------

Description

Check whether the given object is a [CPORetrafo](#) object.

Usage

```
is.retrafo(x)
```

Arguments

x	[any] The object to check.
---	-------------------------------

Value

TRUE if x has class [CPORetrafo](#), FALSE otherwise.

See Also

Other retrafo related: [CPOTrained](#), [NULLCPO](#), [%>>%\(\)](#), [applyCPO\(\)](#), [as.list.CPO](#), [clearRI\(\)](#), [getCPOClass\(\)](#), [getCPOName\(\)](#), [getCPOOperatingType\(\)](#), [getCPOPredictType\(\)](#), [getCPOProperties\(\)](#), [getCPOTrainedCPO\(\)](#), [getCPOTrainedCapability\(\)](#), [getCPOTrainedState\(\)](#), [makeCPOTrainedFromState\(\)](#), [pipeCPO\(\)](#), [print.CPOConstructor\(\)](#)

listCPO	<i>List all Built-in CPOs</i>
---------	-------------------------------

Description

Return a data.frame with the columns “name”, “cponame”, “category”, “subcategory”, “description”.

Categories and subcategories are:

category	subcategory	description
meta		CPO that acts on other CPOs
tools		
data	general	
	general data preproc	
	factor data preproc	

	numeric data preproc	
	feature conversion	
	cleanup	
featurefilter	general	fltr CPO with operation arg
	specialised	specific feat filter CPO
imputation	general	imp CPO with operation arg
	specialised	specific imputation CPO
tools	imputation	

Usage

```
listCPO()
```

makeCPO	<i>Create a Custom CPO Constructor</i>
---------	--

Description

makeCPO creates a *Feature Operation CPOConstructor*, i.e. a constructor for a CPO that will operate on feature columns. makeCPOTargetOp creates a *Target Operation CPOConstructor*, which creates CPOs that operate on the target column. makeCPORetrafoless creates a *Retrafoless CPOConstructor*, which creates CPOs that may operate on both feature and target columns, but have no retrafo operation. See [OperatingType](#) for further details on the distinction of these. makeCPOExtendedTrafo creates a *Feature Operation CPOConstructor* that has slightly more flexibility in its data transformation behaviour than makeCPO (but is otherwise identical). makeCPOExtendedTargetOp creates a *Target Operation CPOConstructor* that has slightly more flexibility in its data transformation behaviour than makeCPOTargetOp but is otherwise identical.

See example section for some simple custom CPO.

Usage

```
makeCPO(
  cpo.name,
  par.set = makeParamSet(),
  par.vals = NULL,
  dataformat = c("df.features", "split", "df.all", "task", "factor", "ordered",
    "numeric"),
  dataformat.factor.with.ordered = TRUE,
  export.params = TRUE,
  fix.factors = FALSE,
  properties.data = c("numerics", "factors", "ordered", "missings"),
  properties.adding = character(0),
  properties.needed = character(0),
  properties.target = c("cluster", "classif", "multilabel", "regr", "surv", "oneclass",
    "twoclass", "multiclass"),
  packages = character(0),
  cpo.train,
```

```
    cpo.retrafo
  )

makeCPOExtendedTrafo(
  cpo.name,
  par.set = makeParamSet(),
  par.vals = NULL,
  dataformat = c("df.features", "split", "df.all", "task", "factor", "ordered",
    "numeric"),
  dataformat.factor.with.ordered = TRUE,
  export.params = TRUE,
  fix.factors = FALSE,
  properties.data = c("numerics", "factors", "ordered", "missings"),
  properties.adding = character(0),
  properties.needed = character(0),
  properties.target = c("cluster", "classif", "multilabel", "regr", "surv", "oneclass",
    "twoclass", "multiclass"),
  packages = character(0),
  cpo.trafo,
  cpo.retrafo
)

makeCPORetrafoless(
  cpo.name,
  par.set = makeParamSet(),
  par.vals = NULL,
  dataformat = c("df.all", "task"),
  dataformat.factor.with.ordered = TRUE,
  export.params = TRUE,
  fix.factors = FALSE,
  properties.data = c("numerics", "factors", "ordered", "missings"),
  properties.adding = character(0),
  properties.needed = character(0),
  properties.target = c("cluster", "classif", "multilabel", "regr", "surv", "oneclass",
    "twoclass", "multiclass"),
  packages = character(0),
  cpo.trafo
)

makeCPOTargetOp(
  cpo.name,
  par.set = makeParamSet(),
  par.vals = NULL,
  dataformat = c("df.features", "split", "df.all", "task", "factor", "ordered",
    "numeric"),
  dataformat.factor.with.ordered = TRUE,
  export.params = TRUE,
  fix.factors = FALSE,
```

```

properties.data = c("numerics", "factors", "ordered", "missings"),
properties.adding = character(0),
properties.needed = character(0),
properties.target = "cluster",
task.type.out = NULL,
predict.type.map = c(response = "response"),
packages = character(0),
constant.invert = FALSE,
cpo.train,
cpo.retrafo,
cpo.train.invert,
cpo.invert
)

makeCPOExtendedTargetOp(
  cpo.name,
  par.set = makeParamSet(),
  par.vals = NULL,
  dataformat = c("df.features", "split", "df.all", "task", "factor", "ordered",
    "numeric"),
  dataformat.factor.with.ordered = TRUE,
  export.params = TRUE,
  fix.factors = FALSE,
  properties.data = c("numerics", "factors", "ordered", "missings"),
  properties.adding = character(0),
  properties.needed = character(0),
  properties.target = "cluster",
  task.type.out = NULL,
  predict.type.map = c(response = "response"),
  packages = character(0),
  constant.invert = FALSE,
  cpo.trafo,
  cpo.retrafo,
  cpo.invert
)

```

Arguments

cpo.name	[character(1)] The name of the resulting CPOConstructor / CPO . This is used for identification in output, and as the default id .
par.set	[ParamSet] Optional parameter set, for configuration of CPOs during construction or by hyperparameters. Default is an empty ParamSet . It is recommended to use pSS to construct this, as it greatly reduces the verbosity of creating a ParamSet and makes it more readable.
par.vals	[list NULL] Named list of default parameter values for the CPO. These are used <i>instead</i>

of the parameter default values in `par.set`, if not NULL. It is preferred to use `ParamSet` default values, and not `par.vals`. Default is NULL.

`dataformat` [character(1)]
Indicate what format the data should be as seen by the `cpo.train` and `cpo.retrafo` function. The following table shows what values of `dataformat` lead to what is given to `cpo.train` and `cpo.retrafo` as data and target parameter value. (Note that for Feature Operating CPOs, `cpo.retrafo` has no target argument.) Possibilities are:

dataformat	data	target
"df.all"	data.frame with target cols	target colnames
"df.features"	data.frame without target	data.frame of target
"task"	full Task	target colnames
"split"	list of data.frames by type	data.frame of target
[type]	data.frame of [type] feats only	data.frame of target

[type] can be any one of "factor", "numeric", "ordered"; if these are given, only a subset of the total data present is seen by the [CPO](#).

Note that `makeCPORetrafoless` accepts only "task" and "df.all".

For `dataformat == "split"`, `cpo.train` and `cpo.retrafo` get a list with entries "factor", "numeric", "other", and, if `dataformat.factor.with.ordered` is FALSE, "ordered".

If the CPO is a Feature Operation CPO, then the return value of the `cpo.retrafo` function must be in the same format as the one requested. E.g. if `dataformat` is "split", the return value must be a named list with entries `$numeric`, `$factor`, and `$other`. The types of the returned data may be arbitrary: In the given example, the `$factor` slot of the returned list may contain numeric data. (Note however that if data is returned that has a type not already present in the data, `properties.needed` must specify this.)

For Feature Operating CPOs, if `dataformat` is either "df.all" or "task", the target column(s) in the returned value of the `retrafo` function must be identical with the target column(s) given as input.

If `dataformat` is "split", the `$numeric` slot of the value returned by the `cpo.retrafo` function may also be a [matrix](#). If `dataformat` is "numeric", the returned object may also be a matrix.

Default is "df.features" for all functions except `makeCPORetrafoless`, for which it is "df.all".

`dataformat.factor.with.ordered` [logical(1)]
Whether to treat ordered typed features as factor typed features. This affects how `dataformat` is handled, for which it only has an effect if `dataformat` is "split" or "factor". If `dataformat` is "ordered", this must be FALSE. It also affects how strictly data fed to a [CPORetrafo](#) object is checked for adherence to the data format of data given to the generating [CPO](#). Default is TRUE.

`export.params` [logical(1) | character]
Indicates which CPO parameters are exported by default. Exported parameters can be changed after construction using [setHyperPars](#), but exporting too many

parameters may lead to messy parameter sets if many CPOs are combined using `composeCPO` or `%>%`. The exported parameters can be set during construction, but `export.params` determines the *default* exported parameters. If this is a `logical(1)`, `TRUE` exports all parameters, `FALSE` exports no parameters. It may also be a character, indicating the names of parameters to be exported. Default is `TRUE`.

<code>fix.factors</code>	<p><code>[logical(1)]</code> Whether to constrain factor levels of new data to the levels of training data, for each factorial or ordered column. If new data contains factors that were not present in training data, the values are set to NA. Default is <code>FALSE</code>.</p>
<code>properties.data</code>	<p><code>[character]</code> The kind of data that the CPO will be able to handle. This can be one or more of: “numerics”, “factors”, “ordered”, “missings”. There should be a bias towards including properties. If a property is absent, the preproc operator will reject the data. If an operation e.g. only works on numeric columns that have no missings (like PCA), it is recommended to give all properties, ignore the columns that are not numeric (using <code>dataformat = "numeric"</code>), and giving an error when there are missings in the numeric columns (since missings in factorial features are not a problem). Defaults to the maximal set.</p>
<code>properties.adding</code>	<p><code>[character]</code> Can be one or many of the same values as <code>properties.data</code> for Feature Operation CPOs, and one or many of the same values as <code>properties.target</code> for Target Operation CPOs. These properties <i>get added</i> to a Learner (or CPO) coming after / behind this CPO. When a CPO imputes missing values, for example, this should be “missings”. This must be a subset of “<code>properties.data</code>” or “<code>properties.target</code>”. Note that this may <i>not</i> contain a Task-type property, even if the CPO is a Target Operation CPO that performs conversion. Property names may be postfixed with “.sometimes”, to indicate that adherence should not be checked internally. This distinction is made by not putting them in the <code>\$adding.min</code> slot of the <code>getCPOProperties</code> return value when <code>get.internal = TRUE</code>. Default is <code>character(0)</code>.</p>
<code>properties.needed</code>	<p><code>[character]</code> Can be one or many of the same values as <code>properties.data</code> for Feature Operation CPOs, and one or many of the same values as <code>properties.target</code>. These properties are <i>required</i> from a Learner (or CPO) coming after / behind this CPO. E.g., when a CPO converts factors to numerics, this should be “numerics” (and <code>properties.adding</code> should be “factors”). Note that this may <i>not</i> contain a Task-type property, even if the CPO is a Target Operation CPO that performs conversion. Property names may be postfixed with “.sometimes”, to indicate that adherence should not be checked internally. This distinction is made by not putting them in the <code>\$needed</code> slot of <code>properties</code>. They can still be found in the <code>\$needed.max</code> slot of the <code>getCPOProperties</code> return value when <code>get.internal = TRUE</code>.</p>

	Default is <code>character(0)</code> .
<code>properties.target</code>	<p>[character]</p> <p>For Feature Operation CPOs, this can be one or more of “cluster”, “classif”, “multilabel”, “regr”, “surv”, “oneclass”, “twoclass”, “multiclass”. Just as <code>properties.data</code>, it indicates what kind of data a CPO can work with. To handle data given as <code>data.frame</code>, the “cluster” property is needed. Default is the maximal set.</p> <p>For Target Operation CPOs, this <i>must</i> contain exactly one of “cluster”, “classif”, “multilabel”, “regr”, “surv”. This indicates the type of <code>Task</code> the CPO can work on. If the input is a <code>data.frame</code>, it is treated as a “cluster” type <code>Task</code>. If the <code>properties.target</code> contains “classif”, the value must then also contain one or more of “oneclass”, “twoclass”, or “multiclass”. Default is “cluster”.</p>
<code>packages</code>	<p>[character]</p> <p>Package(s) that should be loaded when the CPO is constructed. This gives the user an error if a package required for the CPO is not available on his system, or can not be loaded. Default is <code>character(0)</code>.</p>
<code>cpo.train</code>	<p>[function NULL]</p> <p>This is a function which must have the parameters <code>data</code> and <code>target</code>, as well as the parameters specified in <code>par.set</code>. (Alternatively, the function may have only some of these arguments and a <code>dotdotdot</code> argument). It is called whenever a CPO is applied to a data set to prepare for transformation of the training <i>and</i> prediction data. Note that this function is only used in Feature Operating CPOs created with <code>makeCPO</code>, and in Target Operating CPOs created with <code>makeCPOExtendedTargetOp</code>.</p> <p>The behaviour of this function differs slightly in Feature Operation and Target Operation CPOs.</p> <p>For Feature Operation CPOs, if <code>cpo.retrafo</code> is NULL, this is a constructor function which must return a “retrafo” function which will then modify (possibly new unseen) data. This <code>retrafo</code> function must have exactly one argument—the (new) data—and return the modified data. The format of the argument, and of the return value of the <code>retrafo</code> function, depends on the value of the <code>dataformat</code> parameter, see documentation there.</p> <p>If <code>cpo.retrafo</code> is not NULL, this is a function which must return a control object. This control object returned by <code>cpo.train</code> will then be given as the control argument of the <code>cpo.retrafo</code> function, along with (possibly new unseen) data to manipulate.</p> <p>For Target Operation CPOs, if <code>cpo.retrafo</code> is NULL, <code>cpo.train.invert</code> (or <code>cpo.invert</code> if <code>constant.invert</code> is TRUE) must likewise be NULL. In that case <code>cpo.train</code>’s return value is ignored and it must define, within its namespace, two functions <code>cpo.retrafo</code> and <code>cpo.train.invert</code> (or <code>cpo.invert</code> if <code>constant.invert</code> is TRUE) which will take the place of the respective functions. <code>cpo.retrafo</code> must take the parameters <code>data</code> and <code>target</code>, and return the modified target <code>target</code> (or <code>data</code>, depending on <code>dataformat</code>) data. <code>cpo.train.invert</code> must take a <code>data</code> and <code>control</code> argument and return either a modified control object, or a <code>cpo.invert</code> function. <code>cpo.invert</code> must have a <code>target</code> and <code>predict.type</code> argument and return the modified target data.</p> <p>If <code>cpo.retrafo</code> is not NULL, <code>cpo.train.invert</code> (or <code>cpo.invert</code> if <code>constant.invert</code></p>

is TRUE) must likewise be non-NULL. In that case, `cpo.train` must return a control object. This control object will then be given as the control argument of both `cpo.retrafo` and `cpo.train.invert` (or the `control.invert` argument of `cpo.invert` if `constant.invert` is TRUE).

This parameter may be NULL, resulting in a so-called *stateless* CPO. For Target Operation CPOs created with `makeCPOTargetOp`, `constant.invert` must be TRUE in this case. A stateless CPO does the same transformation for initial CPO application and subsequent prediction data transformation (e.g. taking the logarithm of numerical columns). Note that `cpo.retrafo` and `cpo.invert` should not have a control argument in a stateless CPO.

`cpo.retrafo`

[function | NULL]

This is a function which must have the parameters `data`, `target` (Target Operation CPOs only) and `control`, as well as the parameters specified in `par.set`. (Alternatively, the function may have only some of these arguments and a `dotdotdot` argument). In Feature Operation CPOs created with `makeCPO`, if `cpo.train` is NULL, the `control` argument must be absent.

This function gets called during the “retransformation” step where prediction data is given to the `CPOretrafo` object before it is given to a fitted machine learning model for prediction. In `makeCPO` Feature Operation CPOs and `makeCPOTargetOp` Target Operation CPOs, this is *also* called during the first `trafo` step, where the `CPO` object is applied to training data.

In Feature Operation CPOs, this function receives the data to be transformed and must return the transformed data in the same format as it received them. The format of data is the same as the format in `cpo.train` and `cpo.trafo`, with the exception that if `dataformat` is “task” or “df.all”, the behaviour here is as if “df.split” had been given.

In Target Operation CPOs created with `makeCPOTargetOp`, this function receives the data and target to be transformed and must return the transformed target. The input format of these parameters depends on `dataformat`. If `dataformat` is “task” or “df.all”, the returned value must be the modified `Task` / `data.frame` with the feature columns not modified. Otherwise, the target values to be modified are in the `target` parameter, and the return value must be a `data.frame` of the modified target values only.

In Target Operation CPOs created with `makeCPOExtendedTargetOp`, this function is called during the `retrafo` step, and it must create a `control.invert` object in its environment to be used in the inversion step, as well as return the modified target data. The format of the data given to `cpo.retrafo` in Target Operation CPOs created with `makeCPOExtendedTargetOp` is the same as in other functions, with the exception that, if `dataformat` is “df.all” or “task”, the full `data.frame` or `Task` will be given as the `target` parameter, while the `data` parameter will behave as if `dataformat` “df.split”. Depending on what object the `CPOretrafo` object was applied to, the `target` argument *may be* NULL; in that case NULL must also be returned by the function.

If `cpo.invert` is NULL, `cpo.retrafo` should create a `cpo.invert` function in its environment instead of creating the control object; this function should then take the `target` and `predict.type` arguments. If `constant.invert` is TRUE, this function does not need to define the `control.invert` or `cpo.invert` variables, they are instead taken from `cpo.trafo`.

cpo.trafo	<p>[function]</p> <p>This is a function which must have the parameters <code>data</code> and <code>target</code>, as well as the parameters specified in <code>par.set</code>. (Alternatively, the function may have only some of these arguments and a <code>dotdotdot</code> argument). It is called whenever a CPO is applied to a data set to transform the training data, and (except for Retrafoless CPOs) to collect a control object used by other transformation functions. Note that this function is not used in <code>makeCPO</code>.</p> <p>This functions primary task is to transform the given data when the CPO gets applied to training data. For Target Operating CPOs (created with <code>makeCPOExtendedTargetOp(!)</code>), it must return the complete transformed target column(s), unless <code>dataformat</code> is “<code>df.all</code>” (in which case the complete, modified, <code>data.frame</code> must be returned) or “<code>task</code>” (in which case the complete, modified, <code>Task</code> must be returned). It must furthermore create the control objects for <code>cpo.retrafo</code> and <code>cpo.invert</code>, or create these functins themselves, and save them in its function environment (see below). For Retrafoless CPOs (created with <code>makeCPORetrafoless</code>) and Feature Operation CPOs (created with <code>makeCPOExtendedTrafo(!)</code>), it must return the data in the same format as received it in its <code>data</code> argument (depending on <code>dataformat</code>). If <code>dataformat</code> is a <code>df.all</code> or <code>task</code>, this means the target column(s) contained in the <code>data.frame</code> or <code>Task</code> returned must not be modified. For CPOs that are not Retrafoless, a unit of information to be carried over to the <code>retrafo</code> step needs to be created inside the <code>cpo.trafo</code> function. This unit of information is a variable that must be defined inside the environment of the <code>cpo.trafo</code> function and will be retrieved by the CPO framework.</p> <p>If <code>cpo.retrafo</code> is not <code>NULL</code> the unit is an object named “<code>control</code>” that will be passed on as the <code>control</code> argument to the <code>cpo.retrafo</code> function. If <code>cpo.retrafo</code> is <code>NULL</code>, the unit is a <i>function</i>, called “<code>cpo.retrafo</code>”, that will be used <i>instead</i> of the <code>cpo.retrafo</code> function passed over to <code>makeCPOExtendedTargetOp</code> / <code>makeCPOExtendedTrafo</code>. It must behave the same as the function it replaces, but has only the <code>data</code> (and <code>target</code>, for Target Operation CPOs) argument.</p> <p>For Target Operation CPOs created with <code>makeCPOExtendedTargetOp</code>, another unit of information to be used by <code>cpo.invert</code> must be used. The options here are similar to <code>cpo.retrafo</code>: Either a control object, named <code>control.invert</code>, is created, or the <code>cpo.invert</code> function itself is given (and <code>cpo.invert</code> in the <code>makeCPOExtendedTargetOp</code> call is set to <code>NULL</code>), with the <code>target</code> and <code>predict.type</code> arguments.</p>
task.type.out	<p>[character(1) NULL]</p> <p>If Task conversion is to take place, this is the output task that the data should be converted to. Note that the CPO framework takes care of the conversion if <code>dataformat</code> is not “<code>task</code>”, but the target column needs to have the proper format for that.</p> <p>If this is <code>NULL</code>, Tasks will not be converted. Default is <code>NULL</code>.</p>
predict.type.map	<p>[character list]</p> <p>This becomes the CPO’s <code>predict.type</code>, explained in detail in PredictType.</p> <p>In short, the <code>predict.type.map</code> is a character vector, or a list of <code>character(1)</code>, with <i>names</i> according to the predict types <code>predict</code> can request in its <code>predict.type</code> argument when the created CPO was used as part of a CPOLearner to create the</p>

model under consideration. The *values* of `predict.type.map` are the `predict.type` that will be requested from the underlying `Learner` for prediction.

`predict.type.map` thus determines the format that the `target` parameter of `cpo.invert` can take: It is the format according to `predict.type.map[predict.type]`, where `predict.type` is the respective `cpo.invert` parameter.

`constant.invert`

[logical(1)]

Whether the `cpo.invert` step should not have information from the previous `cpo.retrafo` or `cpo.train.invert` step in Target Operation CPOs (`makeCPOTargetOp` or `makeCPOExtendedTargetOp`).

For `makeCPOTargetOp`, if this is `TRUE`, the `cpo.train.invert` argument must be `NULL`. If `cpo.retrafo` and `cpo.invert` are given, the same control object is given to both of them. Otherwise, if `cpo.retrafo` and `cpo.invert` are `NULL`, the `cpo.train` function must return `NULL` and define a `cpo.retrafo` and `cpo.invert` function in its namespace (see `cpo.train` documentation for more details). If `constant.invert` is `FALSE`, `cpo.train` may either return a control object that will then be given to `cpo.train.invert`, or define a `cpo.retrafo` and `cpo.train.invert` function in its namespace.

For `makeCPOExtendedTargetOp`, if this is `TRUE`, `cpo.retrafo` does not need to generate a `control.invert` object. The `control.invert` object created in `cpo.rafo` will then always be given to `cpo.invert` for all data sets.

Default is `FALSE`.

`cpo.train.invert`

This is a function which must have the parameters `data`, and `control`, as well as the parameters specified in `par.set`. (Alternatively, the function may have only some of these arguments and a `dotdotdot` argument).

This function receives the feature columns given for prediction, and must return a control object that will be passed on to the `cpo.invert` function, *or* it must return a *function* that will be treated as the `cpo.invert` function if the `cpo.invert` argument is `NULL`. In the latter case, the returned function takes exactly two arguments (the prediction column to be inverted, and `predict.type`), and otherwise behaves identically to `cpo.invert`.

If `constant.invert` is `TRUE`, this must be `NULL`.

`cpo.invert`

[function | `NULL`]

This is a function which must have the parameters `target` (a `data.frame` containing the columns of a prediction made), `control.invert`, and `predict.type`, as well as the parameters specified in `par.set`. (Alternatively, the function may have only some of these arguments and a `dotdotdot` argument).

The `predict.type` *requested* by the `predict` or `invert` call is given as a `character(1)` in the `predict.type` argument. Note that this is not necessarily the `predict.type` of the prediction made and given as `target` argument, depending on the value of `predict.type.map` (see there).

This function performs the inversion for a Target Operation CPO. It takes a control object, which summarizes information from the training and `retrafo` step, and the prediction as returned by a machine learning model, and undoes the operation done to the `target` column in the `cpo.rafo` function.

For example, if the `trafo` step consisted of taking the logarithm of a regression target, the `cpo.invert` function could return the exponentiated prediction values by taking the `exp` of the only column in the `target.data.frame` and returning the result of that. This kind of operation does not need the `cpo.retrafo` step and should have `skip.retrafo` set to `TRUE`.

As a more elaborate example, a CPO could train a model on the training data and set the target values to the *residues* of that trained model. The `cpo.retrafo` function would then make predictions with that model on the new prediction data and save the result to the `control` object. The `cpo.invert` function would then add these predictions to the predictions given to it in the `target` argument to “invert” the antecedent subtraction of model predictions from target values when taking the residues.

Value

`CPOConstructor` . A Constructor for CPOs.

CPO Internals

The `mlrCPO` package offers a powerful framework for handling the tasks necessary for preprocessing, so that the user, when creating custom CPOs, can focus on the actual data transformations to perform. It is, however, useful to understand *what* it is that the framework does, and how the process can be influenced by the user during CPO definition or application. Aspects of preprocessing that the user needs to influence are:

Operating Type The core of preprocessing is the actual transformation being performed. In the most general sense, there are three points in a machine learning pipeline that preprocessing can influence.

1. Transformation of training data *before model fitting*, done in `mlr` using `train`. In the CPO framework (*when not using a `CPOLearner` which makes all of these steps transparent to the user*), this is done by a CPO.
2. transformation of new validation or prediction data that is given to the fitted model for *prediction*, done using `predict`. This is done by a `CPORetrafo` retrieved using `retrafo` from the result of step 1.
3. transformation of the predictions made to invert the transformation of the target values done in step 1, which is done using the `CPOInverter` retrieved using `inverter` from the result of step 2.

The framework poses restrictions on primitive (i.e. not compound using `composeCPO`) CPOs to simplify internal operation: A CPO may be one of three **OperatingTypes** (see there). The *Feature Operation CPO* does not transform target columns and hence only needs to be involved in steps 1 and 2. The *Target Operation CPO* only transforms target columns, and therefore mostly concerns itself with steps 1 and 3. A *Retrafoless CPO* may change both feature and target columns, but may not perform a `retrafo` or `inverter` operation (and is therefore only concerned with step 1). Note that this is effectively a restriction on what kind of transformation a *Retrafoless CPO* may perform: it must not be a transformation of the data or target *space*, it may only act or subtract points within this space.

The Operating Type of a CPO is ultimately dependent on the function that was used to create the `CPOConstructor`: `makeCPO` / `makeCPOExtendedTrafo`, `makeCPOTargetOp` / `makeCPOExtendedTargetOp`, or `makeCPORetrafoless`.

Data Transformation At the core of a CPO is the modification of data it performs. For Feature Operation CPOs, the transformation of each row, during training *and* prediction, should happen in the same way, and it may only depend on the entirety of the *training* data—i.e. the value of a data row in a prediction data set may not influence the transformation of a different prediction data row. Furthermore, if a data row occurs in both training and prediction data, its transformation result should ideally be the same.

This property is ensured by `makeCPO` by splitting the transformation into two functions: One function that collects all relevant information from the training data (called `cpo.train`), and one that transforms given data, using this collected information and (*potentially new, unseen*) data to be transformed (called `cpo.retrafo`). The `cpo.retrafo` function should handle all data as if it were prediction data and unrelated to the data given to `cpo.train`.

Internally, when a CPO gets applied to a data set using `applyCPO`, the `cpo.train` function is called, and the resulting control object is used for a subsequent `cpo.retrafo` call which transforms the data. Before the result is given back from the `applyCPO` call, the control object is used to create a `CPORetrafo` object, which is attached to the result as attribute. Target Operating CPOs additionally create and add a `CPOInverter` object.

When a `CPORetrafo` is then applied to new prediction data, the control object previously returned by `cpo.train` is given, combined with this *new* data, to another `cpo.retrafo` call that performs the new transformation.

`makeCPOExtendedTrafo` gives more flexibility by having calling only the `cpo.trafo` in the training step, which both creates a control object *and* modifies the data. This can increase performance if the underlying operation creates a control object and the transformed data in one step, as for example *PCA* does. Note that the requirement that the same row in training and prediction data should result in the same transformation result still stands. The `cpo.trafo` function returns the transformed data and creates a local variable with the control information, which the CPO framework will access.

Inversion If a CPO performs transformations of the *target* column, the predictions made by a following machine learning process should ideally have this transformation undone, so that if the process makes a prediction that coincides with a target value *after* the transformation, the whole pipeline should return a prediction that equals to the target value *before* this transformation.

This is done by the `cpo.invert` function given to `makeCPOTargetOp`. It has access to information from both the preceding training and prediction steps. During the training step, `cpo.train` creates a control object that is not only given to `cpo.retrafo`, but also to `cpo.train.invert`. This latter function is called before the prediction step, whenever new data is fed to the machine learning process. It takes the new data and the old control object and transforms it to a new `control.invert` object to include information about the prediction data. This object is then given to `cpo.invert`.

It is possible to have Target Operation CPOs that do not require information from the `retrafo` step. This is specified by setting `constant.invert` to `TRUE`. It has the advantage that the same `CPOInverter` can be used for inversion of predictions made with any new data. Otherwise, a new `CPOInverter` object must be obtained for each new data set after the `retrafo` step (using the `inverter` function on the `retrafo` result). Having `constant.invert` set to `TRUE` results in *hybrid* `retrafo` / `inverter` objects: The `CPORetrafo` object can then also be used for inversions. When defining a `constant.invert` Target Operating CPO, no `cpo.train.invert` function is given, and the same control object is given to both `cpo.retrafo` and `cpo.invert`.

makeCPOExtendedTargetOp gives more flexibility and allows more efficient implementation of Target Operating CPOs at cost of more complexity. With this method, a `cpo.trafo` function is given that is executed during the first training step; It must return the transformed target column, as well as a `control` and `control.invert` object. The `cpo.retrafo` function not only transforms the target, but must also create a new `control.invert` object (unless `constant.invert` is TRUE). The semantics of `cpo.invert` is identical with the basic `makeCPOTargetOp`.

`cpo.train-cpo.retrafo` **information transfer** One possibility to transfer information from `cpo.train` to `cpo.retrafo` is to have `cpo.train` return a control object (a [list](#)) that is then given to `cpo.retrafo`. The CPO is then called an *object based* CPO.

Another possibility is to not give the `cpo.retrafo` argument (set it to NULL in the `makeCPO` call) and have `cpo.train` instead return a *function* instead. This function is then used as the `cpo.retrafo` function, and should have access to all relevant information about the training data as a closure. This is called *functional* CPO. To save memory, the actual data (including target) given to `cpo.train` is removed from the environment of its return value in this case (i.e. the environment of the `cpo.retrafo` function). This means the `cpo.retrafo` function may not reference a “data” variable.

There are similar possibilities of functional information transfer for other types of CPOs: `cpo.trafo` in `makeCPOExtendedTargetOp` may create a `cpo.retrafo` function instead of a control object. `cpo.train` in `makeCPOTargetOp` has the option of creating a `cpo.retrafo` and `cpo.train.invert` (`cpo.invert` if `constant.invert` is TRUE) function (and returning NULL) instead of returning a control object. Similarly, `cpo.train.invert` may return a `cpo.invert` function instead of a `control.invert` object. In `makeCPOExtendedTargetOp`, `cpo.trafo` may create a `cpo.retrafo` or a `cpo.invert` function, each optionally instead of a control or `control.invert` object (one *or* both may be functional). `cpo.retrafo` similarly may create a `cpo.invert` function instead of giving a `control.invert` object. Functional information transfer may be more parsimonious and elegant than control object information transfer.

Hyperparameters The action performed by a CPO may be influenced using *hyperparameters*, during its construction as well as afterwards (then using [setHyperPars](#)). Hyperparameters must be specified as a [ParamSet](#) and given as argument `par.set`. Default values for each parameter may be specified in this [ParamSet](#) or optionally as another argument `par.vals`.

Hyperparameters given are made part of the [CPOConstructor](#) function and can thus be given during construction. Parameter default values function as the default values for the [CPOConstructor](#) function parameters (which are thus made optional function parameters of the [CPOConstructor](#) function). The CPO framework handles storage and changing of hyperparameter values. When the `cpo.train` and `cpo.retrafo` functions are called to transform data, the hyperparameter values are given to them as arguments, so `cpo.train` and `cpo.retrafo` functions must be able to accept these parameters, either directly, or with a `...` argument.

Note that with *functional* CPOs, the `cpo.retrafo` function does not take hyperparameter arguments (and instead can usually refer to them by its environment).

Hyperparameters may be *exported* (or not), thus making them available for [setHyperPars](#). Not exporting a parameter has advantage that it does not clutter the [ParamSet](#) of a big CPO or [CPOLearner](#) pipeline with many hyperparameters. Which hyperparameters are exported is chosen during the constructing call of a [CPOConstructor](#), but the default exported hyperparameters can be chosen with the `export.params` parameter.

Properties Similarly to [Learners](#), CPOs may specify what kind of data they are and are not able to

handle. This is done by specifying `.properties.*` arguments. The names of possible properties are the same as possible `LearnerProperties`, but since CPOs mostly concern themselves with data, only the properties indicating column and task types are relevant.

For each CPO one must specify

1. which kind of data does the CPO handle,
2. which kind of data must the CPO or Learner be able to handle that comes *after* the given CPO, and
3. which kind of data handling capability does the given CPO *add* to a following CPO or Learner if coming before it in a pipeline.

The specification of (1) is done with `properties.data` and `properties.target`, (2) is specified using `properties.needed`, and (3) is specified using `properties.adding`. Internally, `properties.data` and `properties.target` are concatenated and treated as one vector, they are specified separately in `makeCPO` etc. for convenience reasons. See `CPOProperties` for details.

The CPO framework checks the `cpo.retrafo` etc. functions for adherence to these properties, so it e.g. throws an error if a `cpo.retrafo` function adds missing values to some data but didn't declare "missings" in `properties.needed`. It may be desirable to have this internal checking happen to a laxer standard than the property checking when composing CPOs (e.g. when a CPO adds missings only with certain hyperparameters, one may still want to compose this CPO to another one that can't handle missings). Therefore it is possible to postfix listed properties with `".sometimes"`. The internal CPO checking will ignore these when listed in `properties.adding` (it uses the 'minimal' set of adding properties, `adding.min`), and it will not declare them externally when listed in `properties.needed` (but keeps them internally in the 'maximal' set of needed properties, `needed.max`). The `adding.min` and `needed.max` can be retrieved using `getCPOProperties` with `get.internal = TRUE`.

Data Format Different CPOs may want to change different aspects of the data, e.g. they may only care about numeric columns, they may or may not care about the target column values, sometimes they might need the actual task used as input. The CPO framework offers to present the data in a specified formats to the `cpo.train`, `cpo.retrafo` and other functions, to reduce the need for boilerplate data subsetting on the user's part. The format is requested using the `dataformat` and `dataformat.factor.with.ordered` parameter. A `cpo.retrafo` function is expected to return data in the same format as it requested, so if it requested a `Task`, it must return one, while if it only requested the feature data `data.frame`, a `data.frame` must be returned.

Task Conversion Target Operation CPOs can be used for conversion between `Tasks`. For this, the `type.out` value must be given. Task conversion works with all values of `dataformat` and is handled by the CPO framework. The `cpo.trafo` function must take care to return the target data in a proper format (see above). Note that for conversion, not only does the `Task` type need to be changed during `cpo.trafo`, but also the *prediction* format (see above) needs to change.

Fix Factors Some preprocessing for factorial columns needs the factor levels to be the same during training and prediction. This is usually not guaranteed by mlr, so the framework offers to do this if the `fix.factors` flag is set.

ID To prevent parameter name clashes when CPOs are concatenated, the parameters are prefixed with the CPOs *id*. The ID can be set during CPO construction, but will default to the CPOs *name* if not given. The name is set using the `cpo.name` parameter.

Packages Whenever a CPO needs certain packages to be installed to work, it can specify these in the `packages` parameter. The framework will check for the availability of the packages and

throw an error if not found *during construction*. This means that loading a CPO from a savefile will omit this check, but in most cases it is a sufficient measure to make the user aware of missing packages in time.

Target Column Format Different **Task** types have the target in a different formats. They are listed here for reference. Target data is in this format when given to the `target` argument of some functions, and must be returned in this format by `cpo.trafo` in Target Operation CPOs. Target values are always in the format of a `data.frame`, even when only one column.

Task type	target format
“classif”	one column of <code>factor</code>
“cluster”	<code>data.frame</code> with zero columns.
“multilabel”	several columns of <code>logical</code>
“regr”	one column of <code>numeric</code>
“surv”	two columns of <code>numeric</code>

When inverting, the format of the `target` argument, as well as the return value of, the `cpo.invert` function depends on the **Task** type as well as the `predict.type`. The requested return value `predict.type` is given to the `cpo.invert` function as a parameter, the `predict.type` of the target parameter depends on this and the `predict.type.map` (see **PredictType**). The format of the prediction, depending on the task type and `predict.type`, is:

Task type	predict.type	target format
“classif”	“response”	<code>factor</code>
“classif”	“prob”	<code>matrix</code> with <code>nclass</code> cols
“cluster”	“response”	<code>integer</code> cluster index
“cluster”	“prob”	<code>matrix</code> with <code>nclustr</code> cols
“multilabel”	“response”	<code>logical matrix</code>
“multilabel”	“prob”	<code>matrix</code> with <code>nclass</code> cols
“regr”	“response”	<code>numeric</code>
“regr”	“se”	2-col <code>matrix</code>
“surv”	“response”	<code>numeric</code>
“surv”	“prob”	[NOT YET SUPPORTED]

All `matrix` formats are `numeric`, unless otherwise stated.

Headless function definitions

In the place of all `cpo.*` arguments, it is possible to make a *headless* function definition, consisting only of the function body. This function body must always begin with a ‘{’. For example, instead of `cpo.retrafo = function(data, control) data[-1]`, it is possible to use `cpo.retrafo = function(data, control) { data[-1] }`. The necessary function head is then added automatically by the CPO framework. This will always contain the necessary parameters (e.g. “data”, “target”, hyperparameters as defined in `par.set`) in the names as required. This can declutter the definition of a **CPOConstructor** and is recommended if the CPO consists of few lines.

Note that if this is used when writing an R package, inside a function, this may lead to the automatic R correctness checker to print warnings.

Examples

```
# an example constant feature remover CPO
constFeatRem = makeCPO("constFeatRem",
  dataformat = "df.features",
  cpo.train = function(data, target) {
    names(Filter(function(x) { # names of columns to keep
      length(unique(x)) > 1
    }, data))
  }, cpo.retrafo = function(data, control) {
    data[control]
  })
# alternatively:
constFeatRem = makeCPO("constFeatRem",
  dataformat = "df.features",
  cpo.train = function(data, target) {
    cols.keep = names(Filter(function(x) {
      length(unique(x)) > 1
    }, data))
  }, data))
# the following function will do both the trafo and retrafo
result = function(data) {
  data[cols.keep]
}
result
}, cpo.retrafo = NULL)
```

 makeCPOCase

Build Data-Dependent CPOs

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

The meta CPO which determines what CPO to apply to a data depending on a provided function. Many parameters coincide with the parameters of [makeCPO](#), it is suggested to read the relevant parameter description there.

makeCPOCase creates a [CPOConstructor](#), while cpoCase can be used as [CPOConstructor](#) itself.

Usage

```
makeCPOCase(
  par.set = makeParamSet(),
  par.vals = list(),
  export.cpos = list(),
  dataformat = c("df.features", "split", "df.all", "task", "factor", "ordered",
    "numeric"),
  dataformat.factor.with.ordered = TRUE,
  properties.data = NULL,
  properties.adding = NULL,
  properties.needed = NULL,
  properties.target = NULL,
  cpo.build
)
```

```
cpoCase(
  par.set = makeParamSet(),
  par.vals = list(),
  export.cpos = list(),
  dataformat = c("df.features", "split", "df.all", "task", "factor", "ordered",
    "numeric"),
  dataformat.factor.with.ordered = TRUE,
  properties.data = NULL,
  properties.adding = NULL,
  properties.needed = NULL,
  properties.target = NULL,
  cpo.build,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

<code>par.set</code>	[ParamSet] Parameters (additionally to the exported CPOs) of the CPO. Default is the empty ParamSet.
<code>par.vals</code>	[list] Named list of default parameter values for the CPO. These are used additionally to the parameter default values of <code>par.set</code> . It is often more elegant to use these default values, and not <code>par.vals</code> . Default is <code>list()</code> . Default is <code>list()</code> .

<code>export.cpos</code>	<p>[list of CPO]</p> <p>List of CPO objects that have their hyperparameters exported. If this is a named list, the names must be unique and represent the parameter name by which they are given to the <code>cpo.build</code> function. They are also the IDs that will be given to the CPOs upon construction. If the list is not named, the IDs (or default names, in case of CPOConstructors), are used instead, and need to be unique.</p> <p>All CPOs in the list must either be all Feature Operation CPOs, all Target Operation CPOs performing the same conversion, or all Retrafoless CPOs.</p> <p>The <code>cpo.build</code> function needs to have an argument for each of the names in the list. The CPO objects are pre-configured by the framework to have the hyperparameter settings as set by the ones exported by <code>cpoCase</code>. Default is <code>list()</code>.</p>
<code>dataformat</code>	<p>[character(1)]</p> <p>Indicate what format the data should be as seen by “<code>cpo.build</code>”. See the parameter in makeCPO for details.</p> <p>Note that if the CPOs in <code>export.cpos</code> are Retrafoless CPOs, this must be either “<code>task</code>” or “<code>df.all</code>”. Default is “<code>df.features</code>”.</p>
<code>dataformat.factor.with.ordered</code>	<p>[logical(1)]</p> <p>Whether to treat ordered typed features as factor typed features. See the parameter in makeCPO. Default is TRUE.</p>
<code>properties.data</code>	<p>[character]</p> <p>See the parameter in makeCPO.</p> <p>The properties of the resulting CPO are calculated from the constituent CPOs automatically in the most lenient way. If this parameter is not NULL, the calculated the given properties are used instead of the calculated properties.</p> <p>Default is NULL.</p>
<code>properties.adding</code>	<p>[character]</p> <p>See the parameter in makeCPO.</p> <p>The properties of the resulting CPO are calculated from the constituent CPOs automatically in the most lenient way. If this parameter is not NULL, the calculated the given properties are used instead of the calculated properties.</p> <p>Default is NULL.</p>
<code>properties.needed</code>	<p>[character]</p> <p>See the parameter in makeCPO.</p> <p>The properties of the resulting CPO are calculated from the constituent CPOs automatically in the most lenient way. If this parameter is not NULL, the calculated the given properties are used instead of the calculated properties.</p> <p>Default is NULL.</p>
<code>properties.target</code>	<p>[character]</p> <p>See the parameter in makeCPO.</p> <p>The properties of the resulting CPO are calculated from the constituent CPOs automatically in the most lenient way. If this parameter is not NULL, the calculated the given properties are used instead of the calculated properties.</p>

	Default is NULL.
<code>cpo.build</code>	<p>[function]</p> <p>This function works similar to <code>cpo.trafo</code> in makeCPO: It has the arguments <code>data</code>, <code>target</code>, one argument for each hyperparameter declared in <code>par.set</code>. However, it also has one parameter for each entry in <code>export.cpos</code>, named by each item in that list. The <code>cpoCase</code> framework supplies the pre-configured CPOs (pre-configured as the exported hyperparameters of <code>cpoCase</code> demand) to the <code>cpo.build</code> code via these parameters. The return value of <code>cpo.build</code> must be a CPO, which will then be used on the data.</p> <p>Just as <code>cpo.trafo</code> in makeCPO, this can also be a ‘headless’ function; it then must be written as an expression, starting with a <code>{</code>.</p>
<code>id</code>	<p>[character(1)]</p> <p><code>id</code> to use as prefix for the CPO’s hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.</p>
<code>export</code>	<p>[character]</p> <p>Either a character vector indicating the parameters to export as hyperparameters, or one of the special values “<code>export.all</code>” (export all parameters), “<code>export.default</code>” (export all parameters that are exported by default), “<code>export.set</code>” (export all parameters that were set during construction), “<code>export.default.set</code>” (export the intersection of the “<code>default</code>” and “<code>set</code>” parameters), “<code>export.unset</code>” (export all parameters that were <i>not</i> set during construction) or “<code>export.default.unset</code>” (export the intersection of the “<code>default</code>” and “<code>unset</code>” parameters). Default is “<code>export.default</code>”.</p>
<code>affect.type</code>	<p>[character NULL]</p> <p>Type of columns to affect. A subset of “<code>numeric</code>”, “<code>factor</code>”, “<code>ordered</code>”, “<code>other</code>”, or NULL to not match by column type. Default is NULL.</p>
<code>affect.index</code>	<p>[numeric]</p> <p>Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is <code>integer(0)</code>.</p>
<code>affect.names</code>	<p>[character]</p> <p>Feature names of feature columns to affect. The order of names given is respected. Default is <code>character(0)</code>.</p>
<code>affect.pattern</code>	<p>[character(1) NULL]</p> <p>grep pattern to match feature names by. Default is NULL (no pattern matching)</p>
<code>affect.invert</code>	<p>[logical(1)]</p> <p>Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.</p>
<code>affect.pattern.ignore.case</code>	<p>[logical(1)]</p> <p>Ignore case when matching features with <code>affect.pattern</code>; see grep. Default is FALSE.</p>
<code>affect.pattern.perl</code>	<p>[logical(1)]</p> <p>Use Perl-style regular expressions for <code>affect.pattern</code>; see grep. Default is FALSE.</p>

```
affect.pattern.fixed
      [logical(1)]
      Use fixed matching instead of regular expressions for affect.pattern; see
      grep. Default is FALSE.
```

Value

[CPO](#) .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), [data.frames](#), [link{Learner}s](#) and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the `id` parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

Other special CPOs: [cpoCbind\(\)](#), [cpoTransformParams\(\)](#), [cpoWrap\(\)](#), [makeCPOMultiplex\(\)](#)

makeCPOMultiplex *CPO Multiplexer*

Description

This is a [CPOConstructor](#) to be used to create a [CPO](#). It is called like any R function and returns the created [CPO](#).

makeCPOMultiplex creates a [CPOConstructor](#), cpoMultiplex is a [CPOConstructor](#).

Usage

```
makeCPOMultiplex(cpos, selected.cpo = NULL)
```

```
cpoMultiplex(
  cpos,
  selected.cpo = NULL,
  id,
  export = "export.default",
  affect.type = NULL,
  affect.index = integer(0),
  affect.names = character(0),
  affect.pattern = NULL,
  affect.invert = FALSE,
  affect.pattern.ignore.case = FALSE,
  affect.pattern.perl = FALSE,
  affect.pattern.fixed = FALSE
)
```

Arguments

cpos	<p>[list of (CPO CPOConstructor)]</p> <p>The CPOs to multiplex. If this is a named list, the names must be unique and represent the index by which selected.cpo selects CPOs. They are also the IDs that will be given to the CPOs upon construction. If the list is not named, the IDs (or default names, in case of CPOConstructors), are used instead, and need to be unique.</p> <p>All CPOs in the list must either be all Feature Operation CPOs, all Target Operation CPOs performing the same conversion, or all Retrafoless CPOs.</p>
selected.cpo	<p>[character(1)]</p> <p>Selected CPO. Will default to the first item of cpos if NULL. Default is NULL.</p>
id	<p>[character(1)]</p> <p>id to use as prefix for the CPO's hyperparameters. this must be used to avoid name clashes when composing two CPOs of the same type, or with learners or other CPOS with hyperparameters with clashing names.</p>

<code>export</code>	[character] Either a character vector indicating the parameters to export as hyperparameters, or one of the special values “export.all” (export all parameters), “export.default” (export all parameters that are exported by default), “export.set” (export all parameters that were set during construction), “export.default.set” (export the intersection of the “default” and “set” parameters), “export.unset” (export all parameters that were <i>not</i> set during construction) or “export.default.unset” (export the intersection of the “default” and “unset” parameters). Default is “export.default”.
<code>affect.type</code>	[character NULL] Type of columns to affect. A subset of “numeric”, “factor”, “ordered”, “other”, or NULL to not match by column type. Default is NULL.
<code>affect.index</code>	[numeric] Indices of feature columns to affect. The order of indices given is respected. Target column indices are not counted (since target columns are always included). Default is integer(0).
<code>affect.names</code>	[character] Feature names of feature columns to affect. The order of names given is respected. Default is character(0).
<code>affect.pattern</code>	[character(1) NULL] grep pattern to match feature names by. Default is NULL (no pattern matching)
<code>affect.invert</code>	[logical(1)] Whether to affect all features <i>not</i> matched by other <code>affect.*</code> parameters.
<code>affect.pattern.ignore.case</code>	[logical(1)] Ignore case when matching features with <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.perl</code>	[logical(1)] Use Perl-style regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.
<code>affect.pattern.fixed</code>	[logical(1)] Use fixed matching instead of regular expressions for <code>affect.pattern</code> ; see grep . Default is FALSE.

Value

CPO .

General CPO info

This function creates a CPO object, which can be applied to [Tasks](#), `data.frames`, `link{Learner}s` and other CPO objects using the `%>%` operator.

The parameters of this object can be changed after creation using the function [setHyperPars](#). The other hyper-parameter manipulating functions, [getHyperPars](#) and [getParamSet](#) similarly work as one expects.

If the “id” parameter is given, the hyperparameters will have this id as a prefix; this will, however, not change the parameters of the creator function.

Calling a CPOConstructor

CPO constructor functions are called with optional values of parameters, and additional “special” optional values. The special optional values are the id parameter, and the `affect.*` parameters. The `affect.*` parameters enable the user to control which subset of a given dataset is affected. If no `affect.*` parameters are given, all data features are affected by default.

Other special CPOs: `cpoCbind()`, `cpoTransformParams()`, `cpoWrap()`, `makeCPOCase()`

makeCPOTrainedFromState

Create a CPOTrained with Given Internal State

Description

This creates a new `CPOTrained` object which will behave according to the given state. The state should usually be obtained using `getCPOTrainedState` and then slightly modified. No checks for correctness of the state will (or can) be done, it is the user’s responsibility to ensure that the correct `CPOConstructor` is used, and that the state is only modified in a way the CPO can handle.

Usage

```
makeCPOTrainedFromState(constructor, state, get.inverter = FALSE)
```

Arguments

constructor	[CPOConstructor] A cpo constructor.
state	[list] A state gotten from another CPORetrafo or CPOInverter object using getCPOTrainedState.
get.inverter	[logical(1)] Whether to get a CPOInverter. Usually a CPORetrafo is created. This must be TRUE if the state was created from a CPOInverter, FALSE otherwise. Default is FALSE.

Value

CPOTrained . A CPORetrafo or CPOInverter (as if retrieved using `retrafo` or `inverter` after a primitive CPO was applied to some data) with the given state.

Other inverter related: `CPOTrained`, `NULLCPO`, `%>>%()`, `applyCPO()`, `as.list.CPO`, `clearRI()`, `getCPOClass()`, `getCPOName()`, `getCPOOperatingType()`, `getCPOPredictType()`, `getCPOProperties()`, `getCPOTrainedCPO()`, `getCPOTrainedCapability()`, `getCPOTrainedState()`, `is.inverter()`, `pipeCPO()`, `print.CPOConstructor()`

NULLCPO

CPO Composition Neutral Element

Description

NULLCPO is the neutral element of CPO and CPOTrained composition when using `%>>%` or `composeCPO`. It is furthermore no effect when attached to a `Learner` using `attachCPO` (or `%>>%`), or when applied to data using `applyCPO`, `invert`, or `predict` (or, again, `%>>%`).

NULLCPO works as a stand-in for certain operations that have an "empty" return value: It is returned when `retrafo` and `inverter` are applied to an object that has no retrafa or inverter associated with it, and by `pipeCPO` when applied to an empty list.

NULLCPO can be checked using `is.nullcpo`, and converted from or to NULL using `nullToNullcpo` and `nullcpoToNull`. Otherwise it behaves very similarly to other CPO or CPOTrained objects.

Usage

```
NULLCPO
```

Format

An object of class NULLCPO (inherits from CPOPrimitive, CPORetrafo, CPOInverter, CPOTrained, CPO) of length 0.

 nullcpoToNull

NULLCPO to NULL

Description

Convert [NULLCPO](#) to NULL, leave other values intact.

Usage

```
nullcpoToNull(cpo)
```

Arguments

cpo	[CPO]
	The cpo.

Value

[CPO](#) | NULL . NULL if cpo is NULLCPO, cpo otherwise.

See Also

Other NULLCPO related: [NULLCPO](#), [is.nullcpo\(\)](#), [nullToNullcpo\(\)](#)

nullToNullcpo	<i>NULL to NULLCPO</i>
---------------	------------------------

Description

Convert NULL to [NULLCPO](#), leave other values intact.

Usage

```
nullToNullcpo(cpo)
```

Arguments

cpo	[CPO NULL] The CPO.
-----	---

Value

[CPO](#) . [NULLCPO](#) if cpo is NULL, cpo otherwise.

See Also

Other [NULLCPO](#) related: [NULLCPO](#), [is.nullcpo\(\)](#), [nullcpoToNull\(\)](#)

pipeCPO	<i>Turn a list of CPOs into a Single Chained One</i>
---------	--

Description

Chain a list of preprocessing operators, or retrafo objects, turning `list(a, b, c)` into `a %>>% b %>>% c`.

This is the inverse of [as.list.CPO](#) / [as.list.CPOTrained](#) when applied to [CPO](#) or [CPOTrained](#).

Usage

```
pipeCPO(pplist)
```

Arguments

pplist	[list of CPO list of CPOTrained] A list of CPO or CPOTrained objects.
--------	---

Value

[CPO](#) | [CPOTrained](#) . The compound [CPO](#)([Trained](#)) obtained when chaining the elements of the input list.

print.CPOConstructor *Print CPO Objects*

Description

Prints a simple representation of a [CPOConstructor](#), [CPO](#) or [CPOTrained](#). If verbose is TRUE, more information about the given objects will be given. For [CPOConstructor](#), that is the trafo and retrafo functions, for [CPO](#), the individual constituents of a compound CPO will be printed.

Verbose printing can also be done using the ! operator. !cpo is equivalent to print(cpo, verbose = TRUE).

Usage

```
## S3 method for class 'CPOConstructor'
print(x, verbose = FALSE, ...)

## S3 method for class 'CPO'
print(x, verbose = FALSE, ...)

## S3 method for class 'CPOTrained'
print(x, verbose = FALSE, ...)

## S3 method for class 'CPOConstructor'
!x

## S3 method for class 'CPO'
!x

## S3 method for class 'CPOTrained'
!x
```

Arguments

x	[CPOConstructor CPO CPOTrained] The CPOConstructor to print.
verbose	[logical(1)] Whether to print further information. Default is FALSE.
...	[any] Further arguments.

Value

invisible(NULL) .

pSS *Turn the argument list into a ParamSet*

Description

pSS, short for “ParamSet Sugar”, is a shorthand API for [makeParamSet](#) which enables entry of [ParamSets](#) in short form. It behaves similarly to [makeParamSet](#), but instead of having to construct each parameter individually, the parameters can be given in shorthand form with a convenient syntax, making use of R’s nonstandard evaluation.

This makes definition of [ParamSets](#) shorter and more readable.

The difference between pSS and pSSLrn is only in the default value of `.pss.learner.params` being FALSE for the former and TRUE for the latter.

Usage

```
pSS(..., .pss.learner.params = FALSE, .pss.env = parent.frame())
```

```
pSSLrn(..., .pss.learner.params = TRUE, .pss.env = parent.frame())
```

Arguments

...	Parameters, see Details below.
.pss.learner.params	[logical] Whether to create <code>LearnerParam</code> instead of <code>Param</code> objects. Default is TRUE for pSSLrn and FALSE for pSS.
.pss.env	[environment] Which environment to use when evaluating expressions. Defaults to the calling function's frame.

Details

The arguments are of the form

```
name = default: type range [^ dimension] [settings].
```

name is any valid R identifier name.

= default Determines the 'default' setting in `makeXXXParam`. Note that this is different from an R function parameter default value, in that it serves only as information to the user and does not set the parameter to this value if it is not given. To define 'no default', use NA or leave the "= default" part out. Leaving it out can cause problems when R's static type checker verifies a package, so this is *only* recommended for interactive sessions and top-level applications. (To actually set a parameter default to NA, use (NA) in parentheses)

type is one of "integer", "numeric", "logical", "discrete", "funct", "character", "untyped". Each of these types leads to a `Param` or `LearnerParam` of the given type to be created. Note that "character" is not available if 'Learner'-parameters are created.

range is optional and only used for *integer*, *numeric*, and *discrete* parameters. For "discrete", it is either [valuelist] with valuelist evaluating to a list, or of the form [value1, value2, ...], creating a discrete parameter of character or numeric values according to value1, value2 etc. If type is one of "integer" or "numeric", range is of the form [lowBound, upBound], where lowBound and upBound must either be numerical (or integer) values indicating the lower and upper bound, or may be missing (indicating the absence of a bound). To indicate an exclusive bound, prefix the values with a tilde ("~"). For a "numeric" variable, to indicate an unbounded value which may not be infinite, you can use ~Inf or ~-Inf, or use tilde-dot ("~.").

^ dimension is optionally determining the dimension of a 'vector' parameter. If it is absent, the result is a normal `Param` or `LearnerParam`, if it is present, the result is a `Vector(Learner)Param`. Note that a one-dimensional `Vector(Learner)Param` is distinct from a normal `(Learner)Param`.

settings may be a collection of further settings to supply to `makeXXXParam` and is optional. To specify one or more settings, put in double square brackets ([[,]]), and comma-separate settings if more than one is present.

Examples

```
pSSLrn(a = NA: integer [~0, ]^2 [[requires = expression(b != 0)]],
      b = -10: numeric [~., 0],
      c: discrete [x, y, 1],
      d: logical,
      e: integer)
```

```
# is equivalent to

makeParamSet(
  makeIntegerVectorLearnerParam("a", len = 2, lower = 1, # note exclusive bound
    upper = Inf, requires = expression(b != 0)),
  makeNumericLearnerParam("b", lower = -Inf, upper = 0,
    allow.inf = FALSE, default = -10), # note infinite value is prohibited.
  makeDiscreteLearnerParam("c", values = list(x = "x", y = "y", `1` = 1)),
  makeLogicalLearnerParam("d"),
  makeIntegerLearnerParam("e"))
```

setCPOId	<i>Set the ID of a CPO Object</i>
----------	-----------------------------------

Description

Sets the *id* of a CPO. Setting the id is also possible during construction by a [CPOConstructor](#) using the id parameter.

The exported hyperparameters of a CPO will all have the id as prefix. This makes it possible to compose CPOs that have clashing parameter names.

Usage

```
setCPOId(cpo, id)
```

Arguments

cpo	[CPO] The cpo.
id	[character(1) NULL] The ID. If this is NULL, the ID is set to the default for the CPO at hand, which is the CPO “name”, see getCPOName .

Value

CPO the CPO with modified id.

See Also

Other getters and setters: [CPO](#), [getCPOAffect\(\)](#), [getCPOClass\(\)](#), [getCPOConstructor\(\)](#), [getCPOId\(\)](#), [getCPOName\(\)](#), [getCPOOperatingType\(\)](#), [getCPOPredictType\(\)](#), [getCPOProperties\(\)](#), [getCPOTrainedCPO\(\)](#), [getCPOTrainedCapability\(\)](#)

Other CPO ID related: [getCPOId\(\)](#)

untyped *defined to avoid problems with the static type checker*

Description

defined to avoid problems with the static type checker

Usage

untyped()

%>>% *CPO Composition / Attachment / Application Operator*

Description

This operator “pipes” data from the source into the sink object.

If both objects are a [CPO](#) object, or both are a [CPOTrained](#) object, they will be composed. A new object, representing the operation of performing both object’s operations in succession, will be created, which can be handled like a new CPO or CPOTrained object. See [composeCPO](#).

If the source object is a [data.frame](#) or a [link\[m1r\]{Task}](#), the transformation operation will be applied to this data, and the same resulting data will be returned. See [applyCPO](#).

If the sink object is a [Learner](#), the CPO will be attached to this learner. The same operation will be performed during the [train](#) and [predict](#) phase; the behaviour during the predict phase may furthermore be depend on the training data. See [attachCPO](#).

Note that you can not link a [data.frame](#) or [Task](#) directly to a [Learner](#), since this operation is not algebraically associative with the composition of CPOs. Use [train](#) for this.

The %<<% operator is synonymous with %>>% with source and sink argument swapped.

The %>|% and %|<% operators perform piping followed by application of [retrafo](#). The %>|% evaluates the expression to its right before the expression to its left, so it may be used in the most natural way without parentheses:

```
data %>|% cpo1 %>>% cpo2
```

is the same as

```
retrafo(data %>>% cpo1 %>>% cpo2).
```

The %<>>% and %<<<% operators perform the piping operation and assign the result to the left hand variable. This way it is possible to apply a [CPO](#), or to attach a [CPO](#) to a [Learner](#), and just keep the resulting object. The assignment operators evaluate their right hand side before their left hand side, so it is possible to build long chains that end up writing to the leftmost variable. Therefore the expression

```
data %<>>% cpo1 %<>>% cpo2 %>>% cpo3
```

is the same as

```
cpo1 = cpo1 %>>% cpo2 %>>% cpo3
```

```
data = data %>>% cpo1
```

Usage

```

cpo1 %>>% cpo2

cpo2 %<<% cpo1

cpo1 %<>>% cpo2

cpo2 %<<<% cpo1

cpo1 %>|% cpo2

cpo2 %|<% cpo1

```

Arguments

```

cpo1      [data.frame | Task | CPO | CPOTrained]
          The source object.

cpo2      [CPO | CPOTrained | Learner]
          The sink object.

```

Value

`data.frame | Task | CPO | CPOTrained` .
